THE 2024 ANNUAL REPORT OF THE BOARD OF TRUSTEES OF THE FEDERAL OLD-AGE AND SURVIVORS INSURANCE AND FEDERAL DISABILITY INSURANCE TRUST FUNDS

## COMMUNICATION

FROM
THE BOARD OF TRUSTEES, FEDERAL OLD-AGE AND SURVIVORS INSURANCE AND FEDERAL DISABILITY INSURANCE TRUST FUNDS

TRANSMITTING
THE 2024 ANNUAL REPORT OF THE BOARD OF TRUSTEES OF THE FEDERAL OLD-AGE AND SURVIVORS INSURANCE AND FEDERAL DISABILITY INSURANCE TRUST FUNDS

## LETTER OF TRANSMITTAL

BOARD OF TRUSTEES OF THE
FEDERAL OLD-AGE AND SURVIVORS INSURANCE AND FEDERAL DISABILITY INSURANCE TRUST FUNDS, Washington, D.C., May 6, 2024

Hon. Mike Johnson,
Speaker of the House of Representatives.
Hon. Kamala D. Harris,
President of the Senate.
Dear Mr. Speaker and Madam President:
We have the honor of transmitting to you the 2024 Annual Report of the Board of Trustes of the Federal Old-Age and Survivors Insurance and Federal Disability Insurance Trust Funds, the 84th such report.

Respectfully,

Janet Yellen,
Secretary of the Treasury, and Managing Trustee of the Trust Funds.

Xavier Becerra,
Secretary of Health and Human Services, and Trustee.

Julie A. Tu, Acting Secretary of Labor, and Trustee.

Martin O'Malley Commissioner of Social Security, and Trustee.

VACANT,
Public Trustee.

VACANT,
Public Trustee.

Ki lobo Kisalzon,
Kilolo Kijakazi,
Principal Senior Advisor to the Commissioner, Social Security Administration, and Secretary, Board of Trustees.

# THE 2024 ANNUAL REPORT OF THE BOARD OF TRUSTEES OF THE FEDERAL OLD-AGE AND SURVIVORS INSURANCE AND FEDERAL DISABILITY INSURANCE TRUST FUNDS 

## I. INTRODUCTION

The Old-Age, Survivors, and Disability Insurance (OASDI) program makes monthly income available to insured workers and their families at retirement, death, or disability. The OASDI program consists of two parts. Retired workers, their families, and survivors of deceased workers receive monthly benefits under the Old-Age and Survivors Insurance (OASI) program. Disabled workers and their families receive monthly benefits under the Disability Insurance (DI) program.

The Social Security Act established the Board of Trustees to oversee the financial operations of the OASI and DI Trust Funds. The Board is composed of six members. Four members serve by virtue of their positions in the Federal Government: the Secretary of the Treasury, who is the Managing Trustee; the Secretary of Labor; the Secretary of Health and Human Services; and the Commissioner of Social Security. The President appoints and the Senate confirms the other two members to serve as public representatives. These two positions are currently vacant. The Deputy Commissioner of the Social Security Administration serves as Secretary of the Board.
The Social Security Act requires that the Board, among other duties, report annually to the Congress on the actuarial status and financial operations of the OASI and DI Trust Funds. The 2024 report is the 84 th such report. The intermediate (best estimate) assumptions for this report were set in December 2023. The Trustees will continue to monitor future developments and modify the projections in later reports as appropriate.

## II. OVERVIEW

## A. HIGHLIGHTS

This section summarizes the report's major findings.
Since the assumptions for last year's report were set, the Trustees have reassessed their expectations based on recent experience and have made changes to the intermediate assumptions in three primary areas. First, given the continued low level of the total fertility rate (TFR) in recent years, the Trustees have revised the ultimate TFR from 2.0 to 1.9 children per woman. Second, with the continued low levels of applications for and awards of disability benefits, the Trustees have reduced the assumed ultimate disabled worker incidence rate from 4.8 to 4.5 per thousand exposed. Third, given that actual growth in gross domestic product (GDP) through 2023 substantially exceeded the growth assumed in last year's report, the Trustees have increased the assumed level of labor productivity over the projection period. Additional factors, including the lower assumed disability incidence rate, have raised the projected employment rate for the working-age population. Together, these changes increase the level of GDP by a total of about 3 percent over the projection period, excluding the eventual offsetting effects of the lower assumed fertility rate. The assumed ultimate rate of growth in productivity remains unchanged from the 2023 report.

The intermediate (best estimate) assumptions for this report were set in December 2023. The Trustees will continue to monitor developments and modify the projections in later reports.

## In 2023

At the end of 2023, the OASDI program was providing benefit payments ${ }^{1}$ to about 67 million people: 53 million retired workers and dependents of retired workers, 6 million survivors of deceased workers, and 9 million disabled workers and dependents of disabled workers. During the year, an estimated 183 million people had earnings covered by Social Security and paid payroll taxes on those earnings. The total cost of the program in 2023 was $\$ 1,392$ billion. Total income was $\$ 1,351$ billion, which consisted of $\$ 1,284$ billion in non-interest income and $\$ 67$ billion in interest earnings. Asset reserves held in special issue U.S. Treasury securities declined from $\$ 2,830$ billion at the beginning of the year to $\$ 2,788$ billion at the end of the year.

[^0]
## Short-Range Results (2024-33)

Under the Trustees' intermediate assumptions, Social Security's total cost is projected to be higher than its total income in 2024 and all later years. Total cost began to be higher than total income in 2021. Social Security's cost has exceeded its non-interest income since 2010.

To illustrate the actuarial status of the Social Security program as a whole, the operations of the OASI and DI Trust Funds are often shown on a combined basis as OASDI. However, by law, the two funds are separate entities and therefore the combined fund operations and reserves are hypothetical. The combined reserves are projected to decrease from $\$ 2,788$ billion at the beginning of 2024 to $\$ 551$ billion at the end of 2033, the last year of the short-range period.

The reserves of the combined OASI and DI Trust Funds along with projected program income are sufficient to cover projected program cost over the next 10 years under the intermediate assumptions. However, the ratio of reserves to annual cost is projected to decline from 188 percent at the beginning of 2024 to 84 percent at the beginning of 2030 and remain below 100 percent for the remainder of the 10 -year short-range period. Because this ratio falls below 100 percent by the end of the 10 th projection year, the combined OASI and DI Trust Funds fail the Trustees' test of short-range financial adequacy. For last year's report, the combined reserves were projected to be 187 percent of annual cost at the beginning of 2024 and 25 percent at the beginning of 2033.

Considered separately, the reserves of the OASI Trust Fund are projected to become depleted during 2033 under the intermediate assumptions. The reserves of the DI Trust Fund along with projected program income are sufficient to cover projected program cost over the next 10 years. The OASI Trust Fund fails the test of short-range financial adequacy, but the DI Trust Fund satisfies the test.

## Long-Range Results (2024-98)

Under the Trustees' intermediate assumptions, OASDI cost exceeds total income in 2024 and in every year thereafter through 2098, and the level of the hypothetical combined trust fund reserves declines until reserves become depleted in 2035, one year later than projected in last year's report. Figure II.D2 shows the implications of reserve depletion for the combined OASI and DI Trust Funds. Considered separately, the OASI Trust Fund reserves become depleted in 2033, which is the same year projected in last

## Overview

year's report. As in last year's report, the DI Trust Fund reserves do not become depleted within the 75 -year long-range projection period. ${ }^{1}$

The DI program continued to have low levels of disability applications and benefit awards through 2023. Disability applications have declined substantially since 2010, and the total number of disabled-worker beneficiaries in current payment status has been falling since 2014. For this report, disability applications are assumed to rise gradually from current low levels, resulting in a rise in the age-sex-adjusted disability incidence rate to an ultimate rate of 4.5 per thousand exposed by the end of the short-range projection period. In last year's report, a higher ultimate disability incidence rate of 4.8 per thousand was assumed.

Over the 75 -year long-range period 2024-98, the projected OASDI annual cost rate (the ratio of program cost to taxable payroll) increases from 14.71 percent of taxable payroll for 2024 to 18.60 percent for 2080, and then decreases generally to 18.12 percent for 2098. The projected cost rate for 2098 is 4.64 percent of taxable payroll more than the projected income rate (the ratio of non-interest income to taxable payroll) for 2098. For last year's report, projected OASDI cost for 2098 was 17.77 percent, or 4.36 percent of payroll more than the annual income rate for that year. When expressed as a share of gross domestic product (GDP), OASDI cost generally rises from 5.2 percent of GDP for 2024 to a peak of about 6.4 percent for 2078, and then declines to 6.1 percent by 2098 .

OASDI cost has generally increased much more rapidly than taxable payroll since 2008 and is projected to continue to do so through about 2040. In this period, the retirement of the baby-boom generation is increasing the number of beneficiaries much faster than the increase in the number of covered workers, as subsequent lower-birth-rate generations replace the baby-boom generation at working ages. Between about 2040 and 2080, the OASDI cost rate continues to grow, but at a slower pace than prior to 2040. After 2080, the OASDI cost rate declines and then stabilizes. These patterns in the cost rate are largely driven by the effect of birth rates on the age distribution of the adult population. Birth rates are assumed to increase from recent very low levels to an ultimate level of 1.9 children per woman for 2040 and thereafter. In last year's report, a higher ultimate total fertility rate of 2.0 children per woman was assumed for 2056 and later.

[^1]The OASDI actuarial deficit is 3.50 percent of taxable payroll for the 75-year projection period through 2098, which is smaller than the value of 3.61 percent of taxable payroll for the 75 -year projection period through 2097 in last year's report. The open-group unfunded obligation for OASDI is 3.32 percent of taxable payroll over the 75 -year projection period through 2098, which is smaller than the value of 3.42 percent of payroll over the 75year projection period through 2097 in last year's report. Expressed in pres-ent-value dollars discounted to January 1, 2024, the open-group unfunded obligation for OASDI is $\$ 22.6$ trillion over the 75 -year projection period through 2098. This value is $\$ 0.2$ trillion more than the measured level in last year's report of $\$ 22.4$ trillion over the 75 -year projection period through 2097, discounted to January 1, 2023. The actuarial deficit and unfunded obligation measures are reported separately for the OASI and DI funds in section IV.B of this report. The OASDI actuarial deficit and the OASDI unfunded obligation both round to 1.2 percent of GDP over the 75 -year projection period through 2098, compared to 1.3 percent for the actuarial deficit and 1.2 percent for the unfunded obligation over the 75 -year projection period through 2097 in last year's report.

If the assumptions, methods, starting values, and the law had all remained unchanged, the actuarial deficit would have increased to 3.67 percent of taxable payroll, and the unfunded obligation would have risen to 3.48 percent of taxable payroll and $\$ 23.2$ trillion in present value due to the change in the valuation date and the extension of the valuation period through an additional year, 2098. The actuarial deficit decreased significantly in this year's report primarily due to changes in economic factors and the lower assumed ultimate disability incidence rate, which are partially offset by the lower assumed ultimate total fertility rate. These changes are described in detail in section IV.B. 6 of this report.

To illustrate the magnitude of the 75-year actuarial deficit, consider that for the combined OASI and DI Trust Funds to remain fully solvent throughout the 75 -year projection period ending in 2098: (1) revenue would have to increase by an amount equivalent to an immediate and permanent payroll tax rate increase of 3.33 percentage points ${ }^{1}$ to 15.73 percent beginning in January 2024; (2) scheduled benefits would have to be reduced by an amount equivalent to an immediate and permanent reduction of 20.8 percent applied to all current and future beneficiaries effective in January 2024, or

[^2]
## Overview

24.8 percent if the reductions were applied only to those who become initially eligible for benefits in 2024 or later; or (3) some combination of these approaches would have to be adopted.

If substantial actions are deferred for several years, the changes necessary to maintain solvency for the combined OASI and DI Trust Funds would be concentrated on fewer years and fewer generations. Significantly larger changes would be necessary if action is deferred until the combined trust fund reserves become depleted in 2035. For example, maintaining 75-year solvency through 2098 with changes that begin in 2035 would require: (1) an increase in revenue by an amount equivalent to a permanent 4.02 percentage point payroll tax rate increase to 16.42 percent starting in 2035 , ( 2 ) a reduction in scheduled benefits by an amount equivalent to a permanent 24.6 percent reduction in all benefits starting in 2035, or (3) some combination of these approaches.

## Conclusion

Under the intermediate assumptions, the projected hypothetical combined OASI and DI Trust Fund asset reserves become depleted and unable to pay scheduled benefits in full on a timely basis in 2035. At the time of depletion of these combined reserves, continuing income to the combined trust funds would be sufficient to pay 83 percent of scheduled benefits. The OASI Trust Fund reserves are projected to become depleted in 2033, at which time OASI income would be sufficient to pay 79 percent of OASI scheduled benefits. DI Trust Fund asset reserves are not projected to become depleted during the 75-year period ending in 2098.

Lawmakers have a broad continuum of policy options that would close or reduce Social Security's long-term financing shortfall. Estimates for many such policy options are available at ssa.gov/OACT/solvency/provisions/.
The Trustees recommend that lawmakers address the projected trust fund shortfalls in a timely way in order to phase in necessary changes gradually and give workers and beneficiaries time to adjust to them. Implementing changes sooner rather than later would allow more generations to share in the needed revenue increases or reductions in scheduled benefits. Social Security will play a critical role in the lives of 68 million beneficiaries and 184 million covered workers and their families during 2024. With informed discussion, creative thinking, and timely legislative action, Social Security can continue to protect future generations.

## B. TRUST FUND FINANCIAL OPERATIONS IN 2023

Table II.B1 shows the income, cost, and asset reserves for the OASI, the DI, and the combined OASI and DI Trust Funds in calendar year 2023.

|  | OASI | DI | OASDI |
| :---: | :---: | :---: | :---: |
| Asset reserves at the end of 2022 | \$2,711.9 | \$118.0 | \$2,829.9 |
| Total income in 2023a | 1,166.9 | 183.8 | 1,350.7 |
| Net payroll tax contributions ${ }^{\text {b }}$ | 1,054.1 | 179.0 | 1,233.1 |
| Interest. | 63.0 | 3.8 | 66.9 |
| Taxation of benefits | 49.8 | . 9 | 50.7 |
| Total cost in 2023. | 1,237.3 | 154.8 | 1,392.1 |
| Benefit payments . | 1,227.4 | 151.9 | 1,379.3 |
| Administrative expenses | 4.4 | 2.8 | 7.2 |
| Railroad Retirement financial interchange | 5.6 | . 1 | 5.6 |
| Net change in asset reserves in 2023 | -70.4 | 29.0 | -41.4 |
| Asset reserves at the end of 2023. . | 2,641.5 | 147.0 | 2,788.5 |

${ }^{\text {a }}$ Includes less than $\$ 50$ million in reimbursements from the General Fund of the Treasury and gifts. See section III.A for details.
${ }^{\mathrm{b}}$ Includes adjustments for prior calendar years.
Note: Components may not sum to totals because of rounding.
In 2023, net payroll tax contributions accounted for 91.3 percent of total trust fund income. Net payroll tax contributions consist of taxes paid by employees, employers, and the self-employed on earnings covered by Social Security. These taxes are paid on covered earnings up to a specified maximum annual amount, which was $\$ 160,200$ in 2023. Table II.B2 shows the payroll tax rates for 2023.

Table II.B2.-Payroll Tax Contribution Rates for 2023
[In percent]

| [In percent] |  |  |  |
| :--- | ---: | ---: | ---: | ---: |
| Payroll tax contribution rate for employees $\ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots$ | OASI | DI | OASDI |
| Payroll tax contribution rate for employers $\ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots$ | 5.3 | 0.9 | 6.2 |
| Payroll tax contribution rate for self-employed persons $\ldots \ldots \ldots \ldots \ldots$ | 10.6 | 1.8 | 12.4 |

Interest earned on invested trust fund asset reserves accounted for 5.0 percent of OASI and DI combined trust fund income in 2023. Revenue from subjecting up to 50 percent of Social Security benefits to Federal personal income taxation for beneficiaries with income (including half of bene-

## Overview

fits and all non-taxable interest received) exceeding specified levels accounted for 3.8 percent of OASDI income.

The Department of the Treasury invests all trust fund income in interestbearing securities issued by the U.S. Government. In 2023, the combined trust fund reserves (the excess of all past income over all past cost) earned interest at an effective annual rate of 2.4 percent.

Retirement, survivor, and disability benefits accounted for 99.1 percent of OASI and DI combined trust fund cost in 2023. The expenses for administering the Social Security program were 0.5 percent of total cost. The net payment to the Railroad Retirement Social Security Equivalent Benefit Account from the combined OASI and DI Trust Funds accounted for 0.4 percent of total OASDI cost.

Trust fund reserves provide the basis for paying benefits. Combined trust fund reserves decreased by $\$ 41.4$ billion during 2023 because income to the combined funds, including interest earned on trust fund reserves, was less than total cost. In last year's report, combined reserves were projected to decrease by $\$ 53.2$ billion in 2023. At the end of 2023, the combined reserves of the OASI and the DI Trust Funds were $\$ 2,788.5$ billion, or 188 percent of estimated cost ${ }^{1}$ for 2024. In comparison, the combined reserves at the end of 2022 were 203 percent of actual cost for 2023.

[^3]
## C. ASSUMPTIONS ABOUT THE FUTURE

The future income and cost of the OASI and DI Trust Funds will depend on many factors, including the size and characteristics of the population receiving benefits, the level of monthly benefit amounts, the size of the workforce, and the level of covered workers' earnings. These factors will depend in turn on future birth rates, death rates, immigration, marriage and divorce rates, retirement patterns, disability incidence and termination rates, employment rates, productivity gains, wage increases, inflation, interest rates, and many other demographic, economic, and program-specific factors.
The Trustees set key demographic, economic, and programmatic assumptions for three alternative scenarios. The intermediate assumptions reflect the Trustees' best estimates of future experience. Therefore, most of the results presented in this overview indicate outcomes under the intermediate assumptions only. Any projection of the future is uncertain. For this reason, results are also presented under low-cost and high-cost alternatives to provide a range of possible future outcomes. The actual future costs are unlikely to be as extreme as those portrayed by the low-cost or high-cost projections. A separate section on the uncertainty of the projections, beginning on page 19, highlights the implications of these alternative scenarios.
The Trustees reexamine the assumptions each year in light of recent experience and new information. This annual review helps to ensure that the Trustees' assumptions provide the best estimate of future possibilities.
For each of the three alternative scenarios, table II.C1 presents key demographic, economic, and programmatic assumptions used for long-range projections. The measures shown are applicable for the last 65 years of the 75 -year projection period, unless otherwise specified. Details on near-term assumptions about growth rates and parameter levels are provided in Chapter V.

## Overview

Table II.C1.-Key Assumptions and Summary Measures for Long-Range (75-Year) Projections ${ }^{\text {a }}$

| Assumption | Intermediate | Low-cost | High-cost |
| :---: | :---: | :---: | :---: |
| Demographic: |  |  |  |
| Total fertility rate (children per woman) for years 2040 and later | 1.9 | 2.1 | 1.6 |
| Annual percentage reduction in total age-sex-adjusted death rates | . 73 | . 28 | 1.23 |
| Annual net lawful permanent resident (LPR) immigration (in thousands) | 788 | 1,000 | 595 |
| Average annual net other-than-LPR immigration (in thousands) | 457 | 683 | 234 |
| Economic: |  |  |  |
| Annual percentage change in productivity (total U.S. economy) | 1.63 | 1.93 | 1.33 |
| Annual percentage change in Consumer Price Index (CPI-W). | 2.4 | 3.0 | 1.8 |
| Average annual percentage change in average OASDI covered wage (nominal) | 3.56 | 4.79 | 2.34 |
| Average annual percentage change in average OASDI covered wage (real) | 1.14 | 1.74 | . 53 |
| Age-sex-adjusted unemployment rate (percent) | 4.5 | 3.5 | 5.5 |
| Annual trust fund new-issue real interest rate (percent) for years 2041 and later. | 2.3 | 2.8 | 1.8 |
| Programmatic: |  |  |  |
| Age-sex-adjusted disability incidence rate (per thousand exposed) | 4.5 | 3.6 | 5.4 |
| Age-sex-adjusted disability recovery rate (per thousand beneficiaries) | 10.8 | 13.0 | 8.6 |

${ }^{\text {a }}$ Measures shown in this table are applicable for the last 65 years of the 75 -year projection period (years 2034-98), unless otherwise specified. See chapter V for additional details, including historical and projected values.

## D. PROJECTIONS OF FUTURE FINANCIAL STATUS

## Short-Range Actuarial Estimates

For the short-range period (2024 through 2033), the Trustees measure financial adequacy using trust fund ratios, which compare projected asset reserves at the beginning of a year to projected program cost for the year. Maintaining a trust fund ratio of 100 percent or more - that is, reserves at the beginning of a year at least equal to projected cost for the year-is a good indication that the trust fund can cover most short-term contingencies. The Trustees' test of short-range financial adequacy is met if under the intermediate assumptions (1) the estimated trust fund ratio is at least 100 percent at the beginning of the period and remains at or above 100 percent throughout the 10-year short-range period (from the beginning of 2024 through the end of 2033, which is indicated by the trust fund ratio at the beginning of 2034) or (2) the ratio is initially less than 100 percent, but reaches at least 100 percent within five years and remains at or above 100 percent throughout the remainder of the 10-year short-range period.

The projected trust fund ratio under the intermediate assumptions for the OASI Trust Fund declines to 95 percent by the beginning of 2029 and remains below 100 percent for the remainder of the short-range period. Therefore, OASI fails the test of short-range financial adequacy. Furthermore, OASI Trust Fund reserves become depleted in the fourth quarter of 2033.

The DI Trust Fund satisfies the test of short-range financial adequacy because the trust fund ratio, while below 100 percent at the beginning of the projection period, reaches 100 percent within five years and stays above 100 percent throughout the remainder of the 10 -year period. The DI trust fund ratio is estimated to be 92 percent at the beginning of 2024. The projected DI trust fund ratio then increases to 104 percent by the beginning of 2025 and continues to increase for the remainder of the short-range period.

On a combined basis, OASDI fails the test of short-range financial adequacy because the OASDI trust fund ratio declines to 84 percent by the beginning of 2030 and remains below 100 percent for the remainder of the short-range period. Figure II.D1 shows that the trust fund ratio for the combined OASI and DI Trust Funds has declined steadily since 2010 and is expected to decline throughout the short-range period.

For this report, the level of the combined trust fund reserves is projected to decline in 2024, as it has since 2021, and to continue to decline throughout the remainder of the short-range period.

Figure II.D1.-Short-Range OASI and DI Combined Trust Fund Ratio
[Asset reserves at beginning of year as a percentage of annual cost for the year, under intermediate assumptions]

## Long-Range Actuarial Estimates

The Trustees use three types of measures to assess the actuarial status of the program over the long-range period (2024 through 2098): (1) annual cashflow measures, including income rates, cost rates, and balances; (2) trust fund ratios; and (3) summary measures such as actuarial balances and opengroup unfunded obligations. These measures are expressed as percentages of taxable payroll, as percentages of gross domestic product (GDP), or in dollars. Appendix F also presents summary measures over the infinite horizon. The infinite horizon values provide an additional indication of Social Security's very-long-run financial condition.
The Trustees also apply a test of long-range close actuarial balance each year. To satisfy the test, a trust fund must meet two conditions: (1) the trust fund satisfies the test of short-range financial adequacy, and (2) the trust fund ratio stays above zero throughout the 75 -year projection period, such that benefits would be payable in a timely manner throughout the period. Under the intermediate assumptions, the OASI Trust Fund and the combined OASI
and DI Trust Funds fail the test of long-range close actuarial balance, while the DI Trust Fund satisfies the test.

## Annual Income Rates, Cost Rates, and Balances

Figure II.D2 illustrates the year-by-year relationship among OASDI income (excluding interest), cost (including scheduled benefits), and expenditures (including payable benefits) starting in 2000 and for the full 75 -year projection period (2024 through 2098). The figure shows all values as percentages of taxable payroll. Under the intermediate assumptions, demographic factors cause the projected cost rate to rise rapidly until about 2040 , then rise more gradually through 2080, and then generally decline through 2098. The projected income rate is relatively stable at somewhat above 13 percent throughout the 75-year period ending in 2098.

Annual OASDI cost has exceeded non-interest income every year beginning with 2010. Cost is projected to continue to exceed non-interest income throughout the 75 -year valuation period. Cost is projected to exceed total income in 2024, as it has each year beginning in 2021, and combined OASI and DI Trust Fund reserves decline until they become depleted in 2035. After trust fund reserve depletion, continuing income is sufficient to support expenditures at a level of 83 percent of program cost for the rest of 2035, declining to 73 percent for 2098. Figure II.D2 depicts OASDI operations as a combined whole. However, under current law, the differences between scheduled and payable benefits for OASI would begin in 2033, when the OASI Trust Fund is projected to become depleted. Scheduled benefits equal payable benefits for DI throughout the entire 75 -year projection period, because the DI Trust Fund is not projected to become depleted during the period.

Figure II.D2.-OASDI Income, Cost, and Expenditures as Percentages of Taxable Payroll [Under intermediate assumptions]

Figure II.D3 shows the estimated number of covered workers per OASDI beneficiary. Figures II.D2 and II.D3 illustrate the inverse relationship between cost rates and the number of workers per beneficiary. In particular, the projected future increase in the cost rate reflects a projected decline in the number of covered workers per beneficiary. There were about 2.7 workers for every OASDI beneficiary in 2023. This ratio had been stable, remaining between 3.2 and 3.4 from 1974 through 2008, and has generally declined since then, initially due to the economic recession of 2007-09 and the beginning of a notable demographic shift. This shift causes the ratio of workers to beneficiaries to decline, as workers of lower-birth-rate generations replace workers of the baby-boom generation. The decline in the ratio slowed substantially between 2013 and 2019 as the recovery of the economy largely offset the demographic shift during that period. The ratio declined slightly in 2020 and then increased slightly by 2022, due to effects of the pandemicinduced recession and recovery on the number of workers. The underlying demographic shift will continue to drive this ratio down over the next 10 to 15 years. The ratio of workers to beneficiaries reaches 2.3 by 2040 when the baby-boom generation will have largely retired, and will generally decline very gradually thereafter due to increasing longevity.

Figure II.D3.-Number of Covered Workers Per OASDI Beneficiary
[Under intermediate assumptions]

Another important way to look at Social Security's future actuarial status is to view its annual cost and non-interest income as a share of U.S. economic output (GDP). As shown in figure II.D4, Social Security's cost as a percent of GDP is generally projected to grow from 5.2 percent in 2024 to a peak of about 6.4 percent for 2078 , and then generally decline to 6.1 percent by 2098. Social Security's non-interest income is 4.6 percent of GDP through 2026 , and then rises gradually to a peak of about 4.8 percent by 2033. Thereafter, non-interest income as a percent of GDP declines gradually, to about 4.5 percent for 2098.

Figure II.D4.-OASDI Cost and Non-Interest Income as a Percentage of GDP [Under intermediate assumptions]

## Trust Fund Ratios

The trust fund ratio is defined as the asset reserves at the beginning of a year expressed as a percentage of the cost during the year. The trust fund ratio thus represents the proportion of a year's cost which could be paid solely with the accumulated reserves at the beginning of the year. Table II.D1 displays the projected maximum trust fund ratios during the long-range period for the OASI, DI, and combined OASI and DI funds. The table also shows the year of maximum projected trust fund ratio during the long-range projection period (2024 through 2098) and the year of trust fund asset reserve depletion. Trust fund ratios for OASI and combined OASI and DI are projected to decline from their current levels until reserve depletion. For DI, the trust fund ratio is projected to rise throughout the 75 -year projection period from 92 percent of annual cost in 2024 to 858 percent of annual cost at the beginning of 2098.

Table II.D1.—Projected Maximum Trust Fund Ratios During the Long-Range Period and Trust Fund Reserve Depletion Dates
[Under Intermediate Assumptions]

|  | OASI | DI | OASDI |
| :---: | :---: | :---: | :---: |
| Maximum projected trust fund ratio (percent) | 200 | 858 | 188 |
| Year attained. | 2024 | 2098 | 2024 |
| Projected year of trust fund reserve depletion | 2033 | a | 2035 |

${ }^{\mathrm{a}}$ The trust fund is not projected to become depleted during the 75-year period ending in 2098.

## Summary Measures

The actuarial balance is a summary measure of the program's financial status through the end of the 75 -year valuation period. The actuarial balance measure includes the trust fund asset reserves at the beginning of the period, all cost and income during the valuation period, and the cost of reaching a target trust fund reserve of one year's cost by the end of the period. Therefore, the actuarial balance is essentially the difference between the present values of income and cost from 1937 through the end of the valuation period, expressed as a percentage of the taxable payroll for the 75 -year valuation period. A negative actuarial balance is called an actuarial deficit. The actuarial deficit represents the average amount of change in income or cost that is needed throughout the valuation period in order to achieve actuarial balance.
In this report, the actuarial deficit for the combined OASI and DI Trust Funds under the intermediate assumptions is 3.50 percent of taxable payroll. The actuarial deficit was 3.61 percent of payroll in the 2023 report. If the assumptions, methods, starting values, and the law had all remained unchanged from last year, the actuarial deficit would have increased to 3.67 percent of payroll solely due to advancing the valuation period by 1 year, from 2023 through 2097 for last year's report to 2024 through 2098 for this year's report. The actuarial deficit is 1.2 percent of GDP in this year's report, decreased from 1.3 percent in last year's report.
Another way to illustrate the projected financial shortfall of the OASDI program is to examine the cumulative present value of scheduled income less cost. Figure II.D5 shows the present value of cumulative OASDI income less cost from the inception of the program through each of the years from 2023 to 2098. A positive value represents the present value of trust fund reserves at the end of the selected year. A negative value is the unfunded obligation through the selected year. The asset reserves of the combined trust funds were about $\$ 2.79$ trillion at the end of 2023 . The combined trust fund reserves decline on a present value basis after 2023, but remain positive through 2034. However, this cumulative amount becomes negative beginning in 2035, which means that the combined OASI and DI Trust Funds have

## Overview

a net unfunded obligation through the end of each year after 2034. Through the end of 2098 , the combined funds have a present-value unfunded obligation of $\$ 22.6$ trillion. If the assumptions, methods, starting values, and the law had all remained unchanged from last year, the unfunded obligation in this year's report would have risen to about $\$ 23.2$ trillion due to the change in the valuation date and the extension of the valuation period through an additional year, 2098.

This unfunded obligation through 2098 for this report represents 3.32 percent of taxable payroll for 2024 through 2098 (decreased from an unfunded obligation through 2097 of 3.42 percent of taxable payroll for 2023 through 2097 in last year's report) and 1.2 percent of GDP over the 75 -year valuation period ending in 2098 (unchanged from the level in last year's report over the 75 -year period ending in 2097). The unfunded obligation as a share of taxable payroll over the period ( 3.32 percent) and the actuarial deficit ( 3.50 percent) are similar measures, but differ because the actuarial deficit includes the cost of having an ending trust fund reserve equal to one year's cost.

Figures II.D2, II.D4, and II.D5 show that the program's actuarial status will deteriorate throughout the projection period if current law is not altered. Negative annual balances and increasing cumulative shortfalls toward the end of the 75-year period provide an indication of the additional change that will be needed by that time in order to maintain solvency beyond 75 years. Consideration of summary measures alone for a 75 -year period can lead to incorrect perceptions and to policy prescriptions that do not achieve sustainable solvency. ${ }^{1}$

[^4]

Appendix F presents summary measures over the infinite horizon. The infinite horizon values provide an additional indication of Social Security's actuarial status extending indefinitely into the future, but results are subject to much greater uncertainty. Extending the horizon beyond 75 years increases the measured unfunded obligation. Through the infinite horizon, the unfunded obligation, or shortfall, is equivalent to 4.5 percent of future taxable payroll or 1.2 percent of future GDP.

## Uncertainty of the Projections

Significant uncertainty surrounds the intermediate assumptions. The Trustees use several methods to help illustrate that uncertainty.
A first approach uses alternative scenarios reflecting intermediate (alternative II), low-cost (alternative I) and high-cost (alternative III) sets of assumptions. The intermediate alternative represents the Trustees' best estimates of future experience. The low-cost alternative includes a higher ultimate total fertility rate, slower improvement in mortality, higher real wage growth, a higher ultimate real interest rate, a higher ultimate annual change in the CPI,

## Overview

a lower unemployment rate, and a lower ultimate disability incidence rate. The high-cost alternative, in contrast, includes a lower ultimate total fertility rate, more rapid improvement in mortality, lower real wage growth, a lower ultimate real interest rate, a lower ultimate annual change in the CPI, a higher unemployment rate, and a higher ultimate disability incidence rate. These alternatives are not intended to suggest that all parameters would be likely to differ from the intermediate values in the specified directions, but are intended to illustrate the effect of clearly defined scenarios that are, on balance, very favorable or very unfavorable for the program's actuarial status. Actual future costs are unlikely to be as extreme as those portrayed by the low-cost or high-cost projections. The method for constructing the low-cost and high-cost projections does not lend itself to estimating the probability that actual experience will lie within or outside the range they define.

Figure II.D6. shows the projected trust fund ratios for the combined OASI and DI Trust Funds under the intermediate, low-cost, and high-cost assumptions. The figure indicates that the combined trust funds are projected to become depleted in 2035 under the intermediate alternative and in 2032 under the high-cost alternative. Under the low-cost alternative, trust fund reserves are projected to become depleted in 2080, but the trust funds would have sufficient income by the end of 2086 to permit full payment of scheduled benefits thereafter and also to pay in arrears the temporary shortfalls between 2080 and 2086.

Figure II.D6.-Long-Range OASI and DI Combined Trust Fund Ratios Under Alternative Scenarios
[Asset reserves as a percentage of annual cost]

Figure II.D7 shows the projected trust fund ratios separately for OASI and DI Trust Funds under the intermediate, low-cost, and high-cost assumptions. The figure indicates that the OASI reserves are projected to become depleted in 2033 under the intermediate alternative, in 2040 under the low-cost alternative, and in 2031 under the high-cost alternative. The DI reserves are projected to become depleted in 2043 under the high-cost alternative, and are not projected to become depleted under the low-cost and intermediate alternatives. This figure illustrates that OASI reserves are expected to become depleted much sooner than DI reserves, and potentially within the next 10 years.

Figure II.D7.-Long-Range OASI and DI Trust Fund Ratios
[Asset reserves as a percentage of annual cost]

Appendix D of this report presents a second approach using long-range sensitivity analysis for the OASDI program. By varying one parameter at a time, sensitivity analysis provides a second approach for illustrating the uncertainty surrounding projections into the future.

A third approach uses 5,000 independently generated stochastic simulations that reflect randomly assigned annual values and central tendencies for most of the key parameters. These simulations produce a distribution of projected outcomes and corresponding probabilities that future experience will fall within or outside a given range. The results of the stochastic simulations, discussed in more detail in appendix E, suggest that trust fund reserve depletion (the point at which reserves are insufficient to pay scheduled benefits in full and on time) is very likely before mid-century. In particular, figure II.D8 indicates that for 95 percent of these stochastic simulations, the reserve depletion year falls within the range from 2032 to 2043. In last year's report, this range was from 2031 to 2040.

The stochastic results suggest that trust fund ratios as high as the low-cost alternative or as low as the high-cost alternative are very unlikely.

Figure II.D8.-Long-Range OASI and DI Combined Trust Fund Ratios From Stochastic Modeling

## Changes From Last Year's Report

The projected long-range OASDI actuarial deficit decreased from 3.61 percent of taxable payroll for last year's report to 3.50 percent of taxable payroll for this year's report. The change in the valuation date and the extension of the 75 -year projection period for an additional year, 2098, would have by itself increased the actuarial deficit to 3.67 percent. Changes in law, methods, starting values, and assumptions combined to decrease the actuarial deficit by 0.17 percent of taxable payroll. This decrease is mainly attributable to changes in economic factors and the lower assumed ultimate disability incidence rate, which are partially offset by the lower assumed ultimate total fertility rate. For a detailed description of the specific changes identified in table II.D2, see section IV.B.6.

## Overview

Table II.D2.-Reasons for Change in the 75-Year Actuarial Balance, Based on Intermediate Assumptions
[As a percentage of taxable payroll]

| Item | OASI | DI | OASDI |

${ }^{\text {a }}$ Between -0.005 and 0.005 percent of taxable payroll.
${ }^{\mathrm{b}}$ The change in the 75 -year valuation period from last year's report to this report means that the 75 -year actuarial balance now includes the relatively large negative annual balance for 2098. This change in the valuation period results in a larger long-range actuarial deficit. The actuarial deficit includes the trust fund reserve at the beginning of the projection period.
Note: Components may not sum to totals because of rounding.
Figure II.D9 compares this year's projections of annual balances (non-interest income minus cost) to those in last year's report. The annual balances in this year's report are generally higher (less negative) in years through 2077 and lower thereafter. For the full 75 -year projection period, the annual balances average 0.13 percentage point higher in this year's report.

Figure II.D9.-OASDI Annual Balances: 2023 and 2024 Trustees Reports [As a percentage of taxable payroll, under the intermediate assumptions]

## E. CONCLUSION

The data and projections presented in this report continue to include the Trustees' best estimates of the future course of the population, the economy, and all aspects of the OASDI program under current law. Since the assumptions for last year's report were set, the Trustees have reassessed their expectations based on recent experience and have made changes to the intermediate assumptions in three primary areas: (1) lowering the ultimate total fertility rate, (2) lowering the ultimate disability incidence rate, and (3) increasing the level of labor productivity over the projection period, given that economic growth through 2023 exceeded the Trustees' expectations.

The intermediate (best estimate) assumptions for this report were set in December 2023. The Trustees will continue to monitor developments and modify the projections in later reports.

Based on the Trustees' intermediate assumptions, Social Security's cost exceeds total income in 2024, as it has since 2021, and remains higher than income throughout the remainder of the 75 -year projection period. The projected cost of Social Security increases much more rapidly than taxable payroll through about 2040 primarily because of a decline in the ratio of workers paying taxes to beneficiaries receiving benefits as the baby-boom generation continues to retire and is replaced at working ages with subsequent lower birth-rate generations. Between about 2040 and 2080, the OASDI cost rate continues to grow, but at a slower pace than prior to 2040. After 2080, the OASDI cost rate declines and then roughly stabilizes. These patterns in the cost rate are largely driven by the effect of birth rates on the age distribution of the adult population.

The OASI Trust Fund is projected to have sufficient reserves to pay full benefits on time until 2033. The DI Trust Fund is projected to have sufficient reserves to pay full benefits throughout the 75 -year projection period ending in 2098. Legislative action will be needed to prevent OASI reserve depletion. In the absence of such legislation, continuing income to the trust funds at the time of reserve depletion would be sufficient to pay 79 percent of OASI benefits.

Social Security's combined trust funds are projected to cover full payment of scheduled benefits on a timely basis until the trust fund reserves become depleted in 2035. Full payment of benefits until depletion of the hypothetical combined reserves in 2035 implicitly assumes that the law will have been changed to permit the transfer of funds between OASI and DI as needed. At
the time of reserve depletion, projected continuing income to the combined trust funds equals about 83 percent of the program cost. By 2098, continuing income equals about 73 percent of the program cost.
The actuarial deficit for the combined trust funds under the intermediate assumptions is 3.50 percent of taxable payroll for the 75 -year period through 2098, which is smaller than the deficit of 3.61 percent for the 75 -year period through 2097 in last year's report. To illustrate the magnitude of the deficit, consider that for the combined OASI and DI Trust Funds to remain fully solvent throughout the 75-year projection period ending with 2098: (1) revenue would have to be increased by an amount equivalent to an immediate and permanent payroll tax rate increase of 3.33 percentage points to 15.73 percent; (2) scheduled benefits would have to be reduced by an amount equivalent to an immediate and permanent reduction of 20.8 percent applied to all current and future beneficiaries through 2098, or 24.8 percent if the reductions were applied only to those who become initially eligible for benefits in 2024 or later; or (3) some combination of these approaches would have to be adopted. If actions are deferred for several years, the changes necessary to maintain Social Security solvency through 2098 become concentrated on fewer years and fewer generations.

If lawmakers design legislative solutions only to eliminate the overall actuarial deficit without consideration of year-by-year financing, then a substantial financial imbalance could remain for 2098, the end of the 75 -year valuation period. In that case, the long-range sustainability of program financing could still be in doubt. Sustainable solvency for the financing of the program under a specified set of assumptions is achieved when the projected trust fund ratio is positive throughout the 75-year long-range period and is either stable or rising at the end of the period. Making changes now that achieve sustainable solvency could avoid the need for later legislative changes.

Lawmakers have a broad continuum of policy options that would close or reduce Social Security's long-term financing shortfall. Estimates for many such policy options are available at www.ssa.gov/OACT/solvency/ provisions/. Broadly speaking, the approaches that lawmakers can take include increasing revenue from workers and employers by raising the tax rate or the maximum level of taxable earnings, or by dedicating revenue from other sources; lowering benefits for some or all beneficiaries by changing certain program parameters; or a combination of these approaches. There are many variations on these options, including those that vary the timing, magnitude, and other specifics of the changes under consideration.

## Overview

The Trustees recommend that lawmakers address the projected trust fund shortfalls in a timely way in order to phase in necessary changes gradually and give workers and beneficiaries time to adjust to them. Implementing changes sooner rather than later would allow more generations to share in the needed revenue increases or reductions in scheduled benefits. Social Security will play a critical role in the lives of 68 million beneficiaries and 184 million covered workers and their families during 2024. With informed discussion, creative thinking, and timely legislative action, Social Security can continue to protect future generations.

## III. FINANCIAL OPERATIONS OF THE TRUST FUNDS AND LEGISLATIVE CHANGES IN THE LAST YEAR

## A. OPERATIONS OF THE OLD-AGE AND SURVIVORS INSURANCE (OASI) AND DISABILITY INSURANCE (DI) TRUST FUNDS, IN CALENDAR YEAR 2023

This section presents detailed information on the operations of the OASI and DI Trust Funds ${ }^{1}$ during calendar year 2023. Chapter IV provides projections for calendar years 2024 through 2100.

## 1. OASI Trust Fund

Table III.A1 presents a statement of the income and cost of the Federal OldAge and Survivors Insurance Trust Fund in calendar year 2023, and of the asset reserves in the fund at the beginning and end of the calendar year. As shown in this table, total trust fund income in 2023 amounted to $\$ 1,166.9$ billion, while cost totaled $\$ 1,237.3$ billion, resulting in a decrease in trust fund reserves during 2023 of $\$ 70.4$ billion.

Total income during calendar year 2023 included $\$ 1,059.4$ billion in payroll tax contributions. These contributions include initial appropriations of payroll taxes, made on an estimated basis, and adjustments to appropriations for prior years to reflect actual tax income. The OASI fund paid the General Fund $\$ 5.4$ billion for the estimated amount of employee payroll-tax refunds, partially offsetting these gross contributions. Employees who work for more than one employer during a year and pay contributions on total earnings in excess of the contribution and benefit base are eligible for such refunds. Net payroll tax contributions were therefore $\$ 1,054.1$ billion in 2023.

Net reimbursements from the General Fund of the Treasury amounted to about $\$ 147$ thousand in 2023. Almost all of that amount came from adjustments to prior year reimbursements based on Public Law 111-312, the Tax Relief, Unemployment Insurance Reauthorization, and Job Creation Act of 2010, Public Law 112-78, the Temporary Payroll Tax Cut Continuation Act of 2011, and Public Law 112-96, the Middle Class Tax Relief and Job Creation Act of 2012. These acts specified General Fund reimbursement for temporary reductions in employee and self-employment payroll taxes for earnings in 2011 and 2012.

Income to the OASI Trust Fund based on the taxation of OASI benefits amounted to $\$ 49.8$ billion in 2023. As first required by the 1983 Social Secu-

[^5]rity Amendments, this income comes from two separate sources: (1) Federal income taxation on up to 50 percent of an individual's or couple's OASI benefits under certain circumstances, and (2) a tax withheld from the benefits paid to certain nonresident alien beneficiaries. For the direct Federal income tax portion, Treasury transfers estimated amounts to the OASI Trust Fund in advance at the beginning of each calendar quarter. Treasury makes subsequent adjustments based on the actual amounts shown on annual income tax records. There was one such adjustment made in 2023 resulting in a transfer from the OASI Trust Fund of $\$ 2.3$ billion. The amount of income from direct Federal income taxation on OASI benefits constituted approximately 99 percent of income from benefit taxation. The remaining one percent of the income from benefit taxation is the amounts withheld from the benefits paid to nonresident aliens.

In 2023, the OASI Trust Fund earned $\$ 63.0$ billion in net interest, which consisted of: (1) interest earned on the investments held by the trust fund, (2) interest on adjustments in the allocation of administrative expenses between the trust fund and the General Fund account for the Supplemental Security Income program, (3) interest arising from the revised allocation of administrative expenses among the trust funds, and (4) interest on certain reimbursements to the trust fund.

The remaining income, about $\$ 48$ thousand, consisted of gifts received under the provisions authorizing the deposit of monetary gifts or bequests in the trust funds.

${ }^{\text {c }}$ Includes: (1) interest on adjustments in the allocation of administrative expenses between the trust fund and the General Fund account for the Supplemental Security Income program, (2) interest arising from the revised allocation of administrative expenses among the trust funds, and (3) interest on certain reimbursements to the trust fund.
${ }^{\mathrm{d}}$ Includes net reductions for the recovery of overpayments.
${ }^{\mathrm{e}}$ Reimbursements for costs incurred in performing certain legislatively mandated activities not directly related to administering the OASI program.
${ }^{\mathrm{f}}$ A positive balance represents a situation where the invested securities of the OASI Trust Fund that were redeemed to make cash payments exceeded actual program cash payments. In this situation, this excess amount will be used to partially offset future redemption of additional invested securities.
Note: Components may not sum to totals because of rounding.

Of the $\$ 1,237.3$ billion in total OASI cost in 2023, $\$ 1,227.4$ billion was for net benefit payments, including recovered overpayments, reimbursements from the General Fund for unnegotiated checks, and the reimbursable costs of vocational rehabilitation services. ${ }^{1}$ Net benefit payments increased by 12.8 percent from calendar year 2022 to calendar year 2023. This increase is due primarily to: (1) an increase in the average number of beneficiaries during the year and (2) an increase in the average monthly benefit amount. The increase in the average benefit amount in 2023 was due in part to the automatic cost-of-living benefit increase of 8.7 percent which became effective for December 2022 under the automatic-adjustment provisions in section 215(i) of the Social Security Act. In addition, new beneficiaries tend to have higher monthly benefit amounts than previous beneficiary cohorts, because their initial benefits are based on average wages, which tend to rise faster than the cost of living.

The Railroad Retirement Act requires an annual financial interchange between the Railroad Retirement program and the OASDI program. The purpose of the interchange is to put the OASI and DI Trust Funds in the same financial position in which they would have been had railroad employment always been covered directly by Social Security. The Railroad Retirement Board and the Social Security Administration calculated an interchange of $\$ 5.6$ billion from the OASI Trust Fund to the Social Security Equivalent Benefit Account for June 2023.

The remaining $\$ 4.4$ billion of cost for the OASI Trust Fund was for net administrative expenses. The Social Security Administration charges administrative expenses incurred to administer the OASI program directly to the trust fund on an estimated basis. Periodically, as actual expenses are recorded, adjustments are made to the allocations of administrative expenses for prior periods. These adjustments affect the OASI Trust Fund, the DI Trust Fund, the Hospital Insurance (HI) Trust Fund, the Supplementary Medical Insurance (SMI) Trust Fund, and the General Fund account for the Supplemental Security Income program, and include appropriate interest adjustments. As described earlier, the trust fund accounting records such interest adjustments under investment income.

For 2023, the cost incurred by the Social Security Administration to administer the OASI program was 86 percent of OASI net administrative expenses. The Social Security Administration charged such costs to the trust fund in

[^6]the amount of $\$ 3.8$ billion in 2023. In addition, the Department of the Treasury charged the trust fund $\$ 0.6$ billion in 2023 for services provided in administering the OASI program. A relatively small offset to administrative expenses of $\$ 2$ million in 2023 represents income from miscellaneous receipts due to the trust fund, which may include refunds, penalties, fees, and other receipts.

Finally, the General Fund of the Treasury makes net reimbursements for administrative costs incurred by the Social Security Administration in performing certain legislatively mandated activities that are not directly related to paying OASI benefits. These reimbursements include $\$ 4$ million in costs associated with union activities related to administering the OASI program and $\$ 3$ million in costs of providing information to participants in certain pension plans in 2023. These miscellaneous reimbursements totaled $\$ 7$ million in 2023.

The asset reserves shown for the OASI Trust Fund at the end of calendar year 2023 totaled $\$ 2,641.5$ billion, consisting of $\$ 2,641.4$ billion in U.S. Government obligations and cash totaling $\$ 0.1$ billion. The effective annual rate of interest earned by the reserves in the OASI Trust Fund during calendar year 2023 was 2.4 percent, slightly higher than the 2.3 percent earned during calendar year 2022. Table VI.A4, presented in appendix A, shows a detailed listing of OASI Trust Fund holdings by type of security, interest rate, and year of maturity at the end of calendar years 2022 and 2023.

By law, the Department of the Treasury must invest trust fund reserves in interest-bearing securities backed by the full faith and credit of the United States Government. The securities currently held by the OASI Trust Fund are entirely special issue securities sold by the Treasury only to the trust funds. These special issues are of two types: short-term certificates of indebtedness and longer-term bonds. Daily trust fund tax income is invested in the shortterm certificates of indebtedness which mature on the next June 30 following the date of issue. The trust fund normally acquires long-term special-issue bonds when special issue securities of either type mature on June 30 and must be reinvested. The amount of long-term bonds acquired on June 30 is equal to the amount of special issue securities maturing (including accrued interest earnings), plus tax income for that day, less amounts required to meet cost on that day.

Section 201(d) of the Social Security Act provides that the obligations issued for purchase by the OASI and DI Trust Funds shall have maturities fixed with due regard for the needs of the funds. Each year, bond purchases for each trust fund are made on June 30, taking into account the projected

## Financial Operations and Legislative Changes

reserve depletion date in the most recently issued Trustees Report. The usual practice has been to reinvest the maturing special issue securities, as of each June 30, so that the values of the total portfolio of special issue securities maturing in each of the next 15 years are approximately equal. However, as of June 2023, the most recent projections in the 2023 Trustees Report indicated that the reserves in the OASI Trust Fund would become depleted within 15 years. Therefore, the Department of the Treasury, in consultation with the Chief Actuary of the Social Security Administration, selected the amounts and maturity dates of the OASI special-issue bonds purchased on June 30,2023 , so that the maturity dates of the total portfolio of special issue securities would be spread evenly to the extent possible over the 9 -year period 2024 through 2032. The bonds purchased on that date have an interest rate of 3.875 percent, reflecting the average market yield, as of the last business day of the prior month, on all of the outstanding marketable U.S. obligations that are due or callable more than 4 years in the future. Table III.A7 shows additional details on the investment transactions during 2023, including the amounts of bonds purchased on June 30, 2023.

## 2. DI Trust Fund

Table III.A2 presents a statement of the income and cost of the Federal Disability Insurance Trust Fund in calendar year 2023, and of the asset reserves in the fund at the beginning and end of the calendar year.

Line entries in the DI statement are similar to those in the OASI statement. The explanations of the OASI entries generally apply to DI as well.

Of the $\$ 183.8$ billion in total income, $\$ 179.0$ billion was net payroll tax contributions.

Of the $\$ 154.8$ billion of total cost, $\$ 151.9$ billion was net benefit payments. The total level of net benefit payments increased by 5.8 percent from calendar year 2022 to calendar year 2023, largely due to increases in average monthly benefit amounts and the total amount of retroactive benefits, partially offset by a decrease in the average number of beneficiaries during the year. DI non-interest income, and total income, exceeded total cost in 2023.

| Undisbursed balances ${ }^{\text {f }}$ | 81 |  |
| Total asset reserves, December 31, 2023 |  | 146,973 |

${ }^{\text {a }}$ Includes adjustments for prior calendar years.
${ }^{\mathrm{b}}$ Between - $\$ 0.5$ and $\$ 0.5$ million.
${ }^{\text {c }}$ Includes: (1) interest on adjustments in the allocation of administrative expenses between the trust fund and the General Fund account for the Supplemental Security Income program, (2) interest arising from the revised allocation of administrative expenses among the trust funds, and (3) interest on certain reimbursements to the trust fund.
${ }^{d}$ Includes net reductions for the recovery of overpayments.
${ }^{\mathrm{e}}$ Reimbursements for costs incurred in performing legislatively mandated activities not directly related to administering the DI program.
${ }^{\mathrm{f}}$ A positive balance represents a situation where the invested securities of the DI Trust Fund that were redeemed to make cash payments exceeded actual program cash payments. In this situation, this excess amount will be used to partially offset future redemption of additional invested securities.
Note: Components may not sum to totals because of rounding.

During 2023, the reserves in the DI Trust Fund increased by $\$ 29.0$ billion, from $\$ 118.0$ billion at the end of 2022 to $\$ 147.0$ billion at the end of 2023. This $\$ 147.0$ billion consisted of $\$ 146.9$ billion in U.S. Government obligations and cash totaling $\$ 81$ million. The effective annual rate of interest earned by the asset reserves in the DI Trust Fund during calendar year 2023 was 2.9 percent, somewhat higher than the 2.7 percent earned during calendar year 2022. Table VI.A5 shows a detailed listing of DI Trust Fund holdings by type of security, interest rate, and year of maturity at the end of calendar years 2022 and 2023.

Section 201(d) of the Social Security Act provides that the Treasury securities issued for purchase by the OASI and DI Trust Funds shall have maturities fixed with due regard for the needs of the funds. Each year, bond purchases for each trust fund are made on June 30, taking into account the projected reserve depletion date in the most recently issued Trustees Report. The usual practice has been to reinvest the maturing special issue securities, as of each June 30, so that the values of the securities maturing in each of the next 15 years are approximately equal. Accordingly, the Department of the Treasury, in consultation with the Chief Actuary of the Social Security Administration, selected the amounts and maturity dates of the DI specialissue bonds purchased on June 30, 2023, so that the maturity dates of the total portfolio of special issue securities would be evenly spread to the extent possible over the 15 -year period 2024-38. The bonds purchased have an interest rate of 3.875 percent, reflecting the average market yield, as of the last business day of the prior month, on the outstanding marketable U.S. obligations that are due or callable more than 4 years in the future. Table III.A7 shows details on investment transactions during 2023.

## 3. OASI and DI Trust Funds, Combined

Table III.A3 presents a statement of the operations of the OASI and DI Trust Funds on a hypothetical combined basis. ${ }^{1}$ The entries in this table represent the sums of the corresponding values from tables III.A1 and III.A2. The two preceding subsections that cover OASI and DI provide a description of the nature of these income and cost transactions.

| Actual amount . . . . . . . . . . . . . . . . | 1,350.7 | - | 1,392.1 | - |

${ }^{\text {a }}$ Percentage differences are calculated prior to rounding.
b "Actual" income for 2023 reflects adjustments to payroll tax contributions for prior calendar years (see appendix A for description of these adjustments). "Estimated" income also includes such adjustments, but on an estimated basis.
Note: Components may not sum to totals because of rounding.
A number of factors contribute to differences between estimates and subsequent actual amounts, including: (1) actual values for key demographic, economic, and other variables that differ from earlier assumed levels; and (2) legislation that was enacted or other administrative initiatives that were finalized after the Trustees completed their estimates. In addition, estimates for the 2019 and 2020 Trustees Reports did not anticipate the pandemic and recession, while the actual income and cost for 2023 do reflect the pandemic, contributing to these differences as well.

At the end of calendar year 2023, the OASDI program was providing monthly benefits to about 67.1 million people. The OASI Trust Fund was providing benefits to about 58.6 million people and the DI Trust Fund was
providing benefits to about 8.5 million people. The number of people receiving benefits from the OASI Trust Fund grew by 2.5 percent while the number of people receiving DI benefits fell by 3.7 percent during calendar year 2023. These changes are in large part due to the shifting age distribution of the adult population, with the baby-boom generation (born in 1946-1965) moving increasingly above age 62 for retired worker benefits, and above normal retirement age, where DI benefits are no longer applicable. Table III.A5 shows the estimated distributions of benefit payments in calendar years 2022 and 2023, by type of beneficiary, for each trust fund separately.

Table III.A5.-Distribution of Benefit Payments by Type of Beneficiary or Payment, Calendar Years 2022 and 2023

Note: Investments are shown at par value. Components may not sum to totals because of rounding.

## B. CHANGES IN LAW AND POLICY AFFECTING SOCIAL SECURITY SINCE THE 2023 REPORT

Since the Trustees submitted the 2023 report to Congress, there have been no changes in law, policy, or regulation that are expected to have significant financial effects on the OASDI program. However, there have been continued judicial developments related to immigration policy.

Beginning in July 2021, pursuant to a United States District Court order, the US Citizenship and Immigration Services (USCIS) paused processing of first-time applications under the Deferred Action for Childhood Arrivals (DACA) policy but continued to process renewal applications. The estimates presented in last year's report reflected the assumption that the DACA program would be fully in effect by the middle of 2023 , consistent with the Administration's intent.

On September 13, 2023, the US District Court for the Southern District of Texas issued a decision which generally affirmed the July 2021 order. As a result, USCIS maintained the approach they have been following, which is to not process first-time applications but to continue processing renewal applications.

Changes in DACA policy affect OASDI program operations because those who apply for and receive deferred action status are eligible for work authorization, which leads to additional workers covered by the OASDI program, increased payroll tax revenue, and subsequently increased benefit cost. Because of the continuing court challenges, the estimates in this year's report incorporate an additional assumed one-year delay in the resumption of processing first-time applications, to the middle of 2024. This change is estimated to have a negligible financial effect on the OASDI program over both the short-range and long-range projection periods.

Sections IV.A. 4 and IV.B. 6 of this report provide further description of the magnitude of effects on the financial status of the OASDI program.

## IV. ACTUARIAL ESTIMATES

This chapter presents actuarial estimates of the future financial condition of the Social Security program. These estimates show the income, cost, and asset reserves or unfunded obligation of the OASI and DI Trust Funds: (1) in dollars over the 10-year short-range period; and (2) as a percentage of taxable payroll, as a percentage of gross domestic product, and in present-value dollars over the 75-year long-range period. In addition, the chapter discusses a variety of measures of the adequacy of current program financing. This report distinguishes between: (1) the cost (obligations) of the program, which includes all past and future benefits scheduled under current law; and (2) expenditures, which include actual payments for the past plus only the portion of projected program cost that would be payable with the financing provisions in current law.
This chapter presents the estimates and measures of trust fund financial adequacy for the short-range period (2024 through 2033) first, followed by estimates and measures of actuarial status for the long-range period (2024 through 2098). Summary measures are also provided for trust fund status over the infinite horizon. As described in chapter II of this report, these estimates depend upon a broad set of demographic, economic, and programmatic factors. This chapter presents estimates under three sets of assumptions to show a wide range of possible outcomes, because assumptions related to these factors are subject to uncertainty. The intermediate set of assumptions, designated as alternative II, reflects the Trustees' best estimate of future experience; the low-cost alternative I is significantly more optimistic and the high-cost alternative III is significantly more pessimistic for the trust funds' future financial outlook. The tables of this report show the intermediate estimates first, followed by the low-cost and high-cost estimates. Chapter V describes these three sets of assumptions, along with the actuarial methods used to produce the estimates. Appendix D and appendix E present two additional methods to illustrate the uncertainty of the projections. Appendix D presents sensitivity analyses of the effects of variation in individual factors and appendix E presents probability distributions generated by a stochastic model.

## A. SHORT-RANGE ESTIMATES

The Trustees consider the trust funds to be solvent at any point in time if the funds can pay scheduled benefits in full on a timely basis. A standard measure for assessing solvency is the "trust fund ratio," which is the reserves in a fund at the beginning of a year (not including advance tax transfers) expressed as a percentage of the cost during the year. A positive trust fund ratio indicates that the trust fund was solvent at the end of the prior year. The
trust fund ratio represents the proportion of a year's cost which the reserves available at the beginning of that year can cover. The Trustees assume that a trust fund ratio of 100 percent of annual program cost provides a reasonable "contingency reserve." Maintaining a reasonable contingency reserve is important because the trust funds do not have borrowing authority. After reserves are depleted, the trust funds would be unable to pay scheduled benefits in full on a timely basis if annual revenue were less than annual cost. Unexpected events, such as severe economic recessions, can quickly diminish reserves. In such cases, a reasonable contingency reserve can maintain the ability to pay scheduled benefits while giving lawmakers time to address possible changes to the program.

The test of short-range financial adequacy applies to the OASI and DI Trust Funds individually and combined on a hypothetical basis. ${ }^{1}$ If the estimated trust fund ratio is at least 100 percent at the beginning of the projection period, the test requires that it remain at or above 100 percent throughout the 10 -year period. If the ratio is initially less than 100 percent, then it must reach at least 100 percent within 5 years (without reserve depletion at any time during this period) and then remain at or above 100 percent throughout the remainder of the 10 -year period. This test is applied using the estimates based on the intermediate assumptions. If either trust fund fails this test, then program solvency in the next 10 years is in question, and lawmakers should take prompt action to improve short-range financial adequacy.

## 1. Operations of the OASI Trust Fund

This subsection presents projections, based on the assumptions described in chapter V, of the operations and financial status of the OASI Trust Fund for the period 2024 through 2033. These estimates assume that there are no further changes in the statutory provisions and regulations under which the OASDI program currently operates beyond the changes since last year's report indicated in section III.B. ${ }^{2}$

Estimates of the OASI Trust Fund operations presented in table IV.A1 indicate that the asset reserves of the OASI Trust Fund are projected to decrease in years 2024 through 2033 under all three sets of assumptions. Under the low-cost assumptions, asset reserves remain positive through the end of the short-range period, but under the intermediate and high-cost assumptions, asset reserves become depleted in the fourth quarter of 2033 and the fourth quarter of 2031, respectively. Trust fund ratios are similarly projected to

[^8]
## Actuarial Estimates

decline throughout the 10 -year projection period under all three sets of assumptions. See figure IV.A1 for an illustration of these results.

Based on the intermediate assumptions, the reserves of the OASI Trust Fund drop below 100 percent of annual cost during 2028, to a trust fund ratio of 95 percent at the beginning of 2029 , and remain below 100 percent for the remainder of the short-range period. Consequently, the OASI Trust Fund fails the test of short-range financial adequacy. Furthermore, under the intermediate assumptions, asset reserves become depleted by the end of 2033.

${ }^{\text {a }}$ The OASI Trust Fund reserves become depleted in the fourth quarter of 2033 and the fourth quarter of 2031 under the intermediate and high-cost assumptions, respectively. For any period during which reserves would be depleted, scheduled benefits could not be paid in full on a timely basis, income from taxing benefits would be less than would apply to scheduled benefits, and interest on trust fund reserves would be negligible. Appendix A presents a detailed description of the components of income and cost, along with complete historical values.
b Amounts for 2020 and 2021 are adjusted to include in 2021 operations those benefit payments regularly scheduled in the law to be paid on January 3, 2021, which were actually paid on December 31, 2020 as required by the statutory provision for early benefit payments when the normal delivery date is on a weekend or holiday. Such shifts in payments across calendar years occur periodically whenever January 3rd falls on a Sunday. In order to provide a consistent perspective on trust fund operations over time, all trust fund operations in each year reflect the 12 months of benefits that are regularly scheduled for payment in that year.
${ }^{\mathrm{c}}$ Represents reserves at the beginning of a year (which are identical to reserves at the end of the prior year shown in the "Amount at end of year" column) as a percentage of cost for the year. The trust fund ratio at the beginning of 2034 is projected to be 55 percent under the low-cost assumptions. The asset reserves are expected to become depleted by the beginning of 2034 under the intermediate assumptions.
${ }^{\text {d }}$ Includes adjustments for prior calendar years. For example, in June 2021, an unusually large negative adjustment to payroll tax contributions in the amount of $\$ 30.4$ billion was made because payroll tax revenue credited to the trust fund in 2020 was based on estimates that did not anticipate effects of the pandemic and recession.
${ }^{\mathrm{e}}$ Includes reimbursements from the General Fund of the Treasury to the OASI Trust Fund for: (1) the cost of payroll tax credits provided to employees in 1984 and self-employed persons in 1984-89 by Public Law 98-21; and (2) payroll tax revenue forgone under the provisions of Public Laws 111-147, 111-312, 112-78, and 112-96. Also includes transfers of a portion of proceeds from repayments of loans authorized under Public Law 116-136.
${ }^{\mathrm{f}}$ Revenue from taxation of benefits is the amount that would be assessed on benefit amounts scheduled in the law.
g Between - $\$ 50$ million and $\$ 50$ million.
${ }^{\mathrm{h}}$ When the fund reserves are depleted, values under current law would reflect permissible expenditures only, which would be less than the full cost of paying scheduled benefits shown in this table.
Note: Components may not sum to totals because of rounding.

Figure IV.A1.-Short-Range OASI and DI Trust Fund Ratios
[Asset reserves as a percentage of annual cost]

The estimated income shown in table IV.A1 increases annually under each set of assumptions throughout the short-range projection period, with the exception of a small decrease in 2025 for the high-cost alternative. The estimated increases in income result primarily from the projected increases in OASDI taxable payroll. Employment increases in years 2024 through 2033 for all three alternatives, with the exception of small decreases in covered employment in 2024 and 2025 for the high-cost alternative: the number of covered workers increases under alternatives I, II, and III from 183 million during calendar year 2023 to about 194 million, 190 million, and 186 million, respectively, in 2033. ${ }^{1}$ The total annual amount of taxable payroll increases in years 2024 through 2033 for each alternative. Total taxable payroll increases from $\$ 9,616$ billion in 2023 to $\$ 17,962$ billion, $\$ 15,062$ billion, and $\$ 13,022$ billion in 2033, on the basis of alternatives I, II, and III, respectively. ${ }^{2}$ These increases in taxable payroll are due primarily to: (1) projected increases in employment levels as the working-age population increases; (2) trend increases in average earnings in covered employment (reflecting both real growth and price inflation); (3) increases in the contribu-

[^9]tion and benefit base under the automatic-adjustment provisions; and (4) growth in employment and average earnings.

Interest earnings contribute to the overall projected level of trust fund income during this period. Interest income declines at an increasing rate under the intermediate and high-cost assumptions, as asset reserves approach depletion, and increases generally under the low-cost assumptions, due to the net effects of changes in reserve levels and the patterns of projected interest rates. Under the intermediate assumptions, interest also declines as a share of total OASI Trust Fund income from 5 percent of total trust fund income for 2023 to 1 percent in 2032, prior to asset reserve depletion in 2033.
Rising OASI cost from 2023 through 2033 reflects automatic benefit increases each year after initial benefit eligibility and increases each year for those becoming newly eligible based on rising average earnings levels, as well as the upward trend in the number of beneficiaries. The steady growth in the number of OASI beneficiaries in the past and the expected future growth result both from the aging of the baby-boom generation and from the increase in the proportion of the baby-boom generation that is insured for benefits, relative to earlier lower-birth-rate generations.

The Treasury invests OASI income in financial securities, generally special public-debt obligations of the U.S. Government. The revenue used to make these purchases flows to the General Fund of the Treasury. The trust fund earns interest on these securities, and the Treasury reinvests the proceeds from maturing securities in new securities if not immediately needed to pay program costs. Program expenditures require the redemption of trust fund securities, generally prior to maturity, to cover the payments made from the trust fund.

## 2. Operations of the DI Trust Fund

Table IV.A2 shows the projected operations and financial status of the DI Trust Fund during calendar years 2024 through 2033 under the three sets of assumptions, together with values for actual experience during 2019 through 2023. For 2023, non-interest income was higher than DI cost. Non-interest income increases generally throughout the short-range projection period under each alternative, due to most of the same factors described previously for the OASI Trust Fund beginning on page 46. DI cost grows significantly over the period under each alternative. Under the intermediate and low-cost assumptions, DI reserves are significantly higher at the end of 2033. Under the high-cost assumptions, DI reserves grow to a somewhat higher level at the end of 2033.

Table IV.A2.-Operations of the DI Trust Fund, Calendar Years 2019-2033 ${ }^{\text {a }}$ (Cont.)
[Dollar amounts in billions]

[^10]For the future, DI cost is projected to increase in part due to increases in average benefit levels resulting from: (1) automatic benefit increases and (2) projected increases in the amounts of average monthly earnings on which benefits are based. Future changes in DI cost also reflect changes in the number of DI beneficiaries in current-payment status. In 2023, the number of DI beneficiaries in current-payment status continued the declining trend of the prior nine years. Under the intermediate assumptions, that number of DI beneficiaries is projected to drop further to a low point at the end of 2024, then increase to a level of about 9 million at the end of 2033. The rate of increase after 2024 is much slower than was experienced on average from 1990 to 2010, when the population with the highest disability prevalence rates was growing rapidly due to the aging of the baby-boom generation. See section V.C. 5 for further details.

At the beginning of calendar year 2024, the reserves of the DI Trust Fund represented 92 percent of estimated annual cost. Under the intermediate
assumptions, DI trust fund reserves and the trust fund ratio increase throughout the short-range projection period. The trust fund ratio rises to 104 percent at the beginning of the second projected year, 2025, and continues to increase for the remainder of the short-range period.
Because the reserves of the DI Trust Fund at the beginning of 2024 were less than the estimated annual cost for 2024 , but are projected to increase to above annual cost within five years, and then remain above annual cost throughout the rest of the short-range period under the intermediate assumptions, the DI Trust Fund satisfies the Trustees' test of short-range financial adequacy.

## 3. Operations of the Combined OASI and DI Trust Funds

Table IV.A3 shows the projected operations and status of the combined OASI and DI Trust Funds for calendar years 2024 through 2033 under the three alternatives, together with actual experience in 2019 through 2023. Income and cost for the OASI Trust Fund represent over 80 percent of the corresponding amounts for the combined OASI and DI Trust Funds. Under the intermediate and low-cost assumptions, the combined OASI and DI Trust Funds would have sufficient financial resources to pay all scheduled benefits through the end of the short-range period, although it is important to note that under current law, one trust fund cannot share financial resources with another trust fund. Under the high-cost assumptions, combined OASI and DI trust fund reserves deplete in the second quarter of 2032. The combined OASI and DI Trust Funds do not satisfy the test of short-range financial adequacy because under the intermediate assumptions, trust fund reserves drop below 100 percent of annual cost during 2029, to a trust fund ratio of 84 percent at the beginning of 2030, and remain below 100 percent for the remainder of the short-range period.

${ }^{\mathrm{a}}$ The OASDI Trust Fund reserves become depleted in the second quarter of 2032 under the high-cost assumptions. For any period during which reserves would be depleted, scheduled benefits could not be paid in full on a timely basis, income from taxing benefits would be less than would apply to scheduled benefits, and interest on trust fund reserves would be negligible. Appendix A presents a detailed description of the components of income and cost, along with complete historical values.
${ }^{\mathrm{b}}$ Amounts for 2020 and 2021 are adjusted to include in 2021 operations those benefit payments regularly scheduled in the law to be paid on January 3, 2021, which were actually paid on December 31, 2020 as required by the statutory provision for early benefit payments when the normal delivery date is on a weekend or holiday. Such shifts in payments across calendar years occur periodically whenever January 3rd falls on a Sunday. In order to provide a consistent perspective on trust fund operations over time, all trust fund operations in each year reflect the 12 months of benefits that are regularly scheduled for payment in that year.
${ }^{\mathrm{c}}$ Represents reserves at the beginning of a year (which are identical to reserves at the end of the prior year shown in the "Amount at end of year" column) as a percentage of cost for the year. The trust fund ratio at the beginning of 2034 is projected to be 22 percent under the intermediate, and 91 percent under the low-cost assumptions.
${ }^{\text {d }}$ Includes adjustments for prior calendar years. For example, in June 2021, an unusually large negative adjustment to payroll tax contributions in the amount of $\$ 35.5$ billion was made because payroll tax revenue credited to the trust funds in 2020 was based on estimates that did not anticipate effects of the pandemic and recession.
${ }^{\mathrm{e}}$ Includes reimbursements from the General Fund of the Treasury to the OASI and DI Trust Funds for: (1) the cost of payroll tax credits provided to employees in 1984 and self-employed persons in 1984-89 by Public Law 98-21; and (2) payroll tax revenue forgone under the provisions of Public Laws 111-147, 111-312, 112-78, and 112-96. Also includes transfers of a portion of proceeds from repayments of loans authorized under Public Law 116-136.
${ }^{\mathrm{f}}$ Revenue from taxation of benefits is the amount that would be assessed on benefit amounts scheduled in the law.
g Between - $\$ 50$ million and $\$ 50$ million.
${ }^{h}$ When the fund reserves are depleted, values under current law would reflect permissible expenditures only, which would be less than the full cost of paying scheduled benefits shown in this table.
Note: Components may not sum to totals because of rounding.

## 4. Factors Underlying Changes in 10-Year Trust Fund Ratio Estimates From Last Year's Report

Table IV.A4 presents an analysis of the factors underlying the changes in the intermediate estimates over the short-range projection period for the OASI, DI, and the combined funds from last year's report to this report.

In the 2023 report under the intermediate assumptions, the trust fund ratio for OASI reached 28 percent at the beginning of 2032-the tenth projection year for that report. The change in the short-range valuation period alone, from 2023 through 2032 to 2024 through 2033, lowered the estimated trust fund ratio for the tenth year by 21 percentage points, to 7 percent. All other changes to reflect modifications in law and regulations since last year's report, the most recent data, adjustments to the assumptions for future years, and changes in projection methods combined for a net increase in the ratio for the tenth projection year of 9 percentage points. Therefore, the total change in the tenth year projected trust fund ratio from last year's report to this year's report is a reduction of 12 percentage points to 16 percent.

Legislative and regulatory changes since the 2023 report was published did not have a significant effect on the projected tenth year OASI trust fund ratio. Changes in demographic assumptions over the short-range period decreased the projected tenth year trust fund ratio for OASI by 4 percentage points. Several changes in economic data and assumptions combined to cause a net increase in the OASI trust fund ratio of 12 percentage points by the beginning of 2033. The large increase due to economic factors is primarily due to higher real wage growth over the short-range period, leading to higher payroll tax collections relative to benefits than in last year's report. Incorporating recent programmatic data and assumptions, including actual average benefits and beneficiary counts for 2023, resulted in an increase of 2 percentage points in the tenth year OASI trust fund ratio. Finally, the tenth year trust fund ratio was not affected significantly by changes in the shortrange methodology for this report.

Table IV.A4 also shows corresponding estimates of the factors underlying the changes in the financial projections for the DI Trust Fund and for the combined OASI and DI Trust Funds. The 60-percentage-point increase in the DI trust fund ratio from the beginning of 2032 in last year's report to the beginning of 2033 in this year's report is the net effect of increases and decreases from the factors described above for the OASI Trust Fund, combined with other changes that are significant for DI but not OASI. The large increase of 29 points due to programmatic data and assumptions reflects changes to the assumed ultimate disabled worker age-sex-adjusted incidence rate and age-sex-adjusted recovery rate, as well as low recent disabled-
worker application and incidence rates, and a more gradual return of initial disability application rates to their ultimate levels from recent lows.

## B. LONG-RANGE ESTIMATES

The Trustees use three types of financial measures to assess the actuarial status of the Social Security trust funds under the financing approach specified in current law: (1) annual cash-flow measures, including income rates, cost rates, and balances; (2) trust fund ratios; and (3) summary measures such as actuarial balances and unfunded obligations.

The difference between the annual income rate and annual cost rate, both expressed as percentages of taxable payroll, is the annual balance. The level and trend of the annual balances at the end of the 75 -year projection period are factors used to assess the actuarial status of the program.

The trust fund ratio for a year is the proportion of the year's projected cost that could be paid with fund reserves available at the beginning of the year. Critical factors considered in assessing actuarial status include: (1) the year of depletion of the fund reserves and the percent of scheduled benefits that is still payable after reserves are depleted, (2) the stability of the trust fund ratio at the end of the long-range period, and (3) the level and year of maximum trust fund ratio.

Solvency at any point in time requires that sufficient financial resources are available to pay all scheduled benefits at that time. Solvency is generally indicated by a positive trust fund ratio. "Sustainable solvency" for the financing of the program under a specified set of assumptions is achieved when the projected trust fund ratio is positive throughout the 75-year projection period and is either stable or rising at the end of the period.

Total income and cost are summarized over valuation periods that extend through 75 years and over the infinite horizon. ${ }^{1}$ This section presents several summarized measures, including the actuarial balance and the open- group unfunded obligation. The actuarial balance indicates the size of any surplus or shortfall as a percentage of taxable payroll over the period. The opengroup unfunded obligation indicates the size of any shortfall in present-value dollars.

This section also includes additional information that is used to assess the actuarial status of the Social Security program, including: (1) a comparison of the number of beneficiaries to the number of covered workers, (2) the test of long-range close actuarial balance, and (3) the reasons for the change in the actuarial balance from the last report.

[^11]
## 1. Annual Income Rates, Cost Rates, and Balances

The concepts of income rate and cost rate, expressed as percentages of taxable payroll, are important in the consideration of the long-range actuarial status of the trust funds. The annual income rate is the ratio of all non-interest income to the OASDI taxable payroll for the year. Non-interest income includes payroll taxes, taxes on scheduled benefits, and any General Fund transfers or reimbursements. The OASDI taxable payroll consists of the total earnings subject to OASDI taxes with some relatively small adjustments. ${ }^{1}$ The annual cost rate is the ratio of the cost of the program to the taxable payroll for the year. The cost includes scheduled benefits, administrative expenses, net interchange with the Railroad Retirement program, and payments for vocational rehabilitation services for disabled beneficiaries. For any year, the annual income rate minus the annual cost rate is the annual "balance" for the year.

Table IV.B1 presents a comparison of the estimated annual income rates and cost rates by trust fund and alternative. Table IV.B2 shows the separate components of the annual income rates.

Under the intermediate assumptions, the OASI income rate decreases from 11.48 percent of payroll for 2023 to 11.09 percent of payroll for 2025 . The income rate for 2023 was relatively high because of a large positive adjustment to payroll tax contributions made in June 2023. This adjustment was unusually large because payroll tax revenue credited to the trust fund in 2022 was based on estimates that did not anticipate the stronger-than-expected recovery from the pandemic-induced recession. The OASI income rate generally gradually rises after 2025 , reaching 11.65 percent of taxable payroll for 2098. Income from taxation of benefits causes this gradual increase in the OASI income rate for two main reasons: (1) total scheduled benefits are rising faster than payroll; and (2) the ratio of total income tax on benefits to total benefits increases over time for reasons discussed in detail on page 153.

The OASI cost rate rises rapidly from 2023 to about 2040. During this period, the aging of the baby-boom generation will increase the number of beneficiaries much faster than the number of workers increases, as subsequent lower-birth-rate generations continue to replace the baby-boom generation at working ages. During the 2040s, the cost rate continues to increase, but at a relatively slower pace, because the aging baby-boom generation is gradually replaced at retired worker benefit eligibility ages by the lower-

[^12]
## Actuarial Estimates

birth-rate generations that followed. The OASI cost rate then has another period of relatively faster growth, largely because of a period of low birth rates starting in about 2010. The OASI cost rate reaches a maximum of 16.87 percent for 2080 and then generally declines to 16.32 percent for 2098.

Projections of income rates under the low-cost and high-cost sets of assumptions are similar to those projected for the intermediate assumptions, because income rates are largely a reflection of the payroll tax rates specified in the law, with the changes from taxation of benefits noted above. In contrast, OASI cost rates for the low-cost and high-cost assumptions are significantly different from those projected for the intermediate assumptions. For the lowcost assumptions, the OASI cost rate generally declines from 12.84 percent for 2024 to 12.08 percent for 2052 , rises to 12.43 percent for 2074 , and then generally declines to 11.34 percent for 2098 , at which point the income rate reaches 11.32 percent. For the high-cost assumptions, the OASI cost rate rises throughout the projection period from 13.45 percent for 2024 to 25.69 percent for 2098 , at which point the income rate reaches 12.26 percent.

The pattern of the projected OASI annual balance is important in the analysis of the actuarial status of the program. Under the intermediate assumptions, the annual balance is negative throughout the projection period. The annual deficit increases from 1.39 percent of taxable payroll for 2023 to 5.19 percent for 2080, and generally declines thereafter, reaching 4.67 percent of taxable payroll for 2098.

Under the low-cost assumptions, the OASI annual deficit decreases from 1.70 percent of payroll for 2024 to 0.73 percent of payroll for 2052. After 2052, the annual deficit rises to 1.04 percent for 2074. After 2074, the OASI annual balance generally improves, turning positive in years 2093-97, before becoming negative again and reaching an annual deficit of 0.02 percent in 2098. Under the high-cost assumptions, the OASI annual deficit rises throughout the projection period from 2.18 percent for 2024 to 13.43 percent for 2098.

| First year balance becomes negative and remains negative throughout the 75-year projection period . |  |  | 2010 |  |  | 2033 |  |  | 2010 |

${ }^{\text {a }}$ Income rates include certain reimbursements from the General Fund of the Treasury.
${ }^{\mathrm{b}}$ Benefit payments scheduled to be paid on January 3 are actually paid on December 31 as required by the statutory provision for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. For comparability with the values for historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment each year.
${ }^{\mathrm{c}}$ Between -0.005 and 0.005 percent of taxable payroll.
${ }^{\mathrm{d}}$ The annual balance is projected to be positive throughout the entire 75 -year projection period.
${ }^{\mathrm{e}}$ The annual balance is projected to be negative for a temporary period and then become positive before the end of the projection period.
Notes:

1. The income rate excludes interest income.
2. Revisions of taxable payroll may change some historical values.
3. Components may not sum to totals because of rounding.

Under the intermediate assumptions, the projected DI cost rate is 1.58 percent for 2024. After 2024, the cost rate fluctuates, reaching 1.47 percent for 2033. Then the DI cost rate increases gradually to 1.81 percent for 2055. Thereafter, the cost rate remains relatively stable, decreasing slowly to 1.71 percent for 2084, and then increasing to 1.80 percent for 2098. The DI income rate decreases from 1.87 percent for 2023 to 1.80 percent for 2025 , and is relatively stable thereafter, reaching 1.84 percent for 2098. The annual balance decreases from 0.26 percent of payroll for 2023 to 0.16 percent for 2027, increases to 0.36 percent for 2033 and then decreases to 0.02 percent for 2055. After 2055, the annual balance increases to 0.12 percent for 2084 and then declines to 0.03 percent for 2098 .

Under the low-cost assumptions, the projected DI cost rate declines from 1.53 percent of payroll for 2024 to 1.12 percent for 2037 and then increases to 1.24 percent for 2054. The cost rate then declines through 2083 and increases slowly thereafter, reaching 1.21 percent for 2098. The annual bal-
ance is positive throughout the long-range period, reaching 0.61 percent of payroll for 2098 . Under the high-cost assumptions, the DI cost rate rises from 1.64 percent of payroll for 2024 to 2.57 percent for 2057 and fluctuates thereafter, returning to 2.57 percent for 2098. The DI annual balance declines from 0.19 percent of payroll for 2024 and becomes negative in years 2026 through 2028, positive in years 2029 through 2032, and then negative again in 2033 with annual deficits persisting thereafter. The annual deficits generally increase to 0.76 percent for 2071 , decrease to 0.66 percent for 2087 and then increase to 0.71 percent for 2098.

Figure IV.B 1 shows the patterns of the historical and projected OASI and DI annual cost rates. The patterns in projected OASI and DI cost rates are described earlier in this chapter. Historical annual OASI cost rates shifted upward starting in 2008 and have remained at relatively high levels since then, primarily due to the changing age distribution of the adult population with the retirement of the baby-boom generation and entry of lower birthrate generations into working ages. Historical annual DI cost rates rose substantially between 1990 and 2010 in large part due to: (1) aging of the working population as the baby-boom generation moved from ages 25-44 in 1990, where disability prevalence is low, to ages $45-64$ in 2010, where disability prevalence is much higher; (2) a substantial increase in the percentage of women insured for DI benefits as a result of increased and more consistent rates of employment; and (3) increased disability incidence rates for women to a level similar to those for men by 2010. As of 2010, these three factors have largely stabilized. Other factors that are not yet fully understood, including the changing nature of work, have caused age-sex-adjusted incidence rates and cost rates to generally decline from 2010 to 2023. Figure IV.B1 shows only the income rates for alternative II because the variation in income rates by alternative is very small. Income rates generally increase slowly for each of the alternatives over the long-range period. Taxation of benefits, which is a small portion of income, is the main source of the increases in the income rate and the variation among the alternatives.
Table IV.B1 shows the annual balances for OASI, DI, and OASDI. The pattern of the annual balances is important to the analysis of the actuarial status of the Social Security program as a whole. As seen in figure IV.B1, the magnitude of each of the positive annual balances is the distance between the appropriate cost-rate curve and the income-rate curve above it. The magnitude of each of the annual deficits is the distance between the appropriate cost-rate curve and the income-rate curve below it. Annual balances follow closely the pattern of annual cost rates after 1990 because the payroll tax rate for the OASDI program has not changed and will not under current law, with only small variations in the allocation between DI and OASI except for changes due to the 1994 and the 2016-18 payroll tax rate reallocations.

In the future, the costs of OASI, DI, and the combined OASDI programs as a percentage of taxable payroll are unlikely to fall outside the range encompassed by alternatives I and III because alternatives I and III define a wide range of demographic, economic, and program-specific conditions.

Figure IV.B1.-Long-Range OASI and DI Annual Income Rates and Cost Rates
[As a percentage of taxable payroll]

Long-range OASDI cost and income are most often expressed as percentages of taxable payroll. However, cost and income are also presented as shares of gross domestic product (GDP), the value of goods and services produced during the year in the United States. Under alternative II, the OASDI cost increases from about 5.2 percent of GDP for 2024 to about 6.4 percent for 2078. After 2078, OASDI cost as a percentage of GDP generally declines, reaching about 6.1 percent by 2098 . Appendix G presents full estimates of income and cost relative to GDP.

Table IV.B2 contains historical and projected annual income rates and their components by trust fund and alternative. The annual income rates consist of the scheduled payroll tax rates, the rates of income from taxation of scheduled benefits, and the rates of income from General Fund reimbursements. Projected income from taxation of benefits increases over time for reasons discussed on page 153.

## Actuarial Estimates

${ }^{\text {a }}$ Revenue from taxation of benefits is the amount that would be assessed on benefit amounts scheduled in the law.
${ }^{\mathrm{b}}$ Includes payroll tax revenue forgone under the provisions of Public Laws 111-147, 111-312, 112-78, and 112-96, and other miscellaneous reimbursements. Also includes transfers of a portion of the proceeds from repayments of loans authorized under Public Law 116-136.
c Values exclude interest income.
${ }^{\mathrm{d}}$ Between 0 and 0.005 percent of taxable payroll.
Note: Components may not sum to totals because of rounding.

## 2. Comparison of Workers to Beneficiaries

Under the intermediate assumptions, the OASDI cost rate will rise rapidly between 2024 and about 2040, primarily because the number of beneficiaries rises much more rapidly than the number of covered workers as the babyboom generation continues to retire and is replaced at working ages by lower birth-rate generations. The ratio of OASDI beneficiaries to workers is dominated by the OASI program because all workers eventually die or reach retired worker benefit eligibility age, but only a small minority become eligible for benefits under the DI program. The trends described below are primarily due to demographic changes and thus affect the DI program roughly 20 years earlier than the OASI and OASDI programs. The baby-boom generation had lower fertility rates than their parents, and these are expected to persist for all future generations; therefore, the ratio of OASDI beneficiaries to workers will rise rapidly and reach a permanently higher level after all of the baby-boom generation has retired. Due to increasing longevity, the ratio of beneficiaries to workers will generally rise slowly thereafter. Table IV.B3 provides a comparison of the numbers of covered workers and beneficiaries.

${ }^{\text {a }}$ Workers who are paid at some time during the year for employment on which OASDI taxes are due.
${ }^{\mathrm{b}}$ Beneficiaries with monthly benefits in current-payment status as of June 30.
${ }^{c}$ This column is the sum of OASI and DI beneficiaries. A small number of beneficiaries receive benefits from both funds.
Notes:

1. The number of beneficiaries does not include uninsured individuals who received benefits under section 228 of the Social Security Act. The General Fund of the Treasury reimbursed the trust funds for the costs of most of these individuals.
2. Historical covered worker and beneficiary data are subject to revision.
3. Components may not sum to totals because of rounding.

## Actuarial Estimates

The effect of the demographic shift under the three alternatives on the OASDI cost rates is clear when one considers the projected number of OASDI beneficiaries per 100 covered workers. Compared to the 2023 level of 36 beneficiaries per 100 covered workers, this ratio is projected to rise to 44 by 2040 under the intermediate assumptions because the growth in beneficiaries greatly exceeds the growth in workers. This projected ratio continues to rise through 2080 and then generally declines, reaching 48 under the intermediate assumptions by 2100 . Under the high-cost assumptions, this ratio rises to 67 by 2100 . Under the low-cost assumptions, this ratio rises to 41 by 2040 and then generally declines, reaching 37 by 2100 . Figure IV.B2 shows beneficiaries per 100 covered workers.

For each alternative, the curve in figure IV.B2 is strikingly similar to the corresponding cost-rate curve in figure IV.B1. This similarity emphasizes the extent to which the cost rate is determined by the age distribution of the population. The cost rate is essentially the product of the number of beneficiaries and their average benefit, divided by the product of the number of covered workers and their average taxable earnings. For this reason, the pattern of the annual cost rates is similar to that of the annual ratios of beneficiaries to workers.

Figure IV.B2.-Number of OASDI Beneficiaries Per 100 Covered Workers

Table IV.B3 also shows the number of covered workers per OASDI beneficiary, which was about 2.7 for 2023 . Under the intermediate assumptions,
this ratio declines generally throughout the long-range period, reaching 2.3 for 2040 and 2.1 by 2100 . Under the low-cost assumptions, this ratio declines to 2.5 for 2040 , then generally rises to 2.7 by 2100 . Under the highcost assumptions, this ratio decreases to 1.5 by 2100 .

## 3. Trust Fund Ratios and Test of Long-Range Close Actuarial Balance

Trust fund ratios are critical indicators of the adequacy of the financial resources of the Social Security program. The trust fund ratio for a year is the amount of asset reserves in a fund at the beginning of a year expressed as a percentage of the cost for the year. Under current law, the OASI and DI Trust Funds do not have the authority to borrow other than in the form of advance tax transfers. If reserves held in either trust fund become depleted during a year, and continuing revenue falls short of the cost of scheduled benefits, then full scheduled benefits would not be payable on a timely basis. For this reason, the trust fund ratio is a critical financial measure.

The trust fund ratio serves an additional important purpose in assessing the actuarial status of the program. If the projected trust fund ratio is positive throughout the period and is either level or increasing at the end of the period, then projected adequacy for the long-range period is likely to continue for subsequent reports. Under these conditions, the program has achieved sustainable solvency.

Table IV.B4 shows the projections of trust fund ratios by alternative, without regard to advance tax transfers that would be effected, for the separate and combined OASI and DI Trust Funds. The table also shows the years of trust fund reserve depletion and the percentage of scheduled benefits that would be payable thereafter, by alternative.

Under the intermediate assumptions, the OASI trust fund ratio is projected to decline from 200 percent at the beginning of 2024 until the trust fund reserves become depleted in 2033 (the same year as projected in last year's report), at which time 79 percent of scheduled benefits would be payable.

The DI Trust Fund remains solvent throughout the long-range period under the intermediate assumptions, as in last year's report. The DI trust fund ratio increases throughout the projection period from 92 percent at the beginning of 2024 to 866 percent for 2099. Because the DI trust fund ratio is positive throughout the 75 -year projection period and increasing at the end of the period, the DI program achieves sustainable solvency under the intermediate assumptions.

Under the intermediate assumptions, the trust fund ratio for the combined OASI and DI Trust Funds declines from 188 percent at the beginning of 2024 until the combined fund reserves become depleted in 2035 (one year
later than projected in last year's report), at which time 83 percent of scheduled benefits would be payable.

Under the low-cost assumptions, the trust fund ratio for the DI program increases from 2024 throughout the projection period, from 93 percent at the beginning of 2024 to the extremely high level of 4,486 percent for 2099 . For the OASI program, the trust fund ratio declines steadily, from 200 percent for 2024 until the reserves become depleted in 2040, at which time 90 percent of scheduled benefits would be payable. For the combined OASDI program, the trust fund ratio declines from 188 percent for 2024 until the combined fund reserves become depleted in 2080 . However, the trust funds would have sufficient income by the end of 2086 to permit full payment of scheduled benefits thereafter and also to pay in arrears the temporary shortfalls between 2080 and 2086. By 2087, trust fund reserves become positive and the trust fund ratio increases thereafter, to a ratio of 56 percent for 2099. Because the DI trust fund ratio is positive throughout the projection period and increasing at the end of the period, the DI program achieves sustainable solvency under the low-cost assumptions.

Under the high-cost assumptions, the OASI trust fund ratio declines from 200 percent for 2024 until reserves become depleted in 2031, at which time 72 percent of scheduled benefits would still be payable. The DI trust fund ratio increases from 91 percent for 2024 to 98 percent for 2025, and then generally declines until the reserves become depleted in 2043. At that time, 81 percent of scheduled benefits would still be payable. The combined OASI and DI trust fund ratio declines from 188 percent for 2024 until reserves become depleted in 2032, at which time 75 percent of scheduled benefits would still be payable.

Trust fund reserve depletion occurs within the 75-year projection period for the OASI Trust Fund under the low-cost, intermediate, and high-cost assumptions, and for the DI Trust Fund under the high-cost assumptions. It is therefore very likely that lawmakers will need to increase income, reduce program costs, or both, in order to maintain solvency for the OASI Trust Fund. The stochastic projections discussed in appendix E suggest that OASI and combined OASI and DI Trust Fund reserve depletion is highly probable before mid-century.
In the 2023 report, the combined trust fund reserves were projected to become depleted in 2031 and 2034 under the high-cost and intermediate assumptions, respectively, and become temporarily depleted between 2067 and 2092 under the low-cost assumptions.

${ }^{\text {a }}$ Benefit payments scheduled to be paid on January 3 are actually paid on December 31 as required by the statutory provision for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. For comparability with the values for historical years and the projections in this report, all trust fund ratios reflect the 12 months of benefits scheduled for payment each year.
${ }^{\mathrm{b}}$ Trust fund reserves would be depleted at the beginning of this year.
${ }^{\mathrm{c}}$ Trust fund reserves would not be depleted within the projection period.
${ }^{\mathrm{d}}$ Trust fund reserves would be depleted for a temporary period, and return to positive levels before the end of the period.
Note: The definition of trust fund ratio appears in the Glossary. The ratios shown for the combined trust funds for years after reserve depletion of either the DI or OASI Trust Fund are hypothetical.

Since 2013, when the Trustees last modified the test of long-range close actuarial balance, the standard for each trust fund requires meeting two conditions: (1) the test of short-range financial adequacy is satisfied; and (2) the trust fund ratios stay above zero throughout the 75 -year projection period, allowing scheduled benefits to be paid in a timely manner throughout the period. Both the long-range test and the short-range test are applied based on

## Actuarial Estimates

the intermediate set of assumptions. As discussed in section IV.A, the DI Trust Fund passes the test of short-range financial adequacy because the trust fund ratio, while below 100 percent at the beginning of the projection period, reaches 100 percent within 5 years and stays above 100 percent throughout the remainder of the 10 -year period. The OASI and combined OASI and DI Trust Funds fail the test of short-range financial adequacy because the trust fund ratios drop below 100 percent by the end of the 10 -year period. Under the intermediate assumptions, the OASI Trust Fund reserves become depleted in 2033, DI Trust Fund reserves stay positive throughout the 75-year period, and the combined OASI and DI Trust Fund reserves become depleted in 2035. Therefore, the OASI and combined OASI and DI Trust Funds fail the test of long-range close actuarial balance, and the DI program passes the test of long-range close actuarial balance.

Figure IV.B3 illustrates the trust fund ratios for the separate OASI and DI Trust Funds for each of the alternative sets of assumptions. DI Trust Fund status is more uncertain than OASI Trust Fund status because there is a high degree of uncertainty associated with future disability prevalence. A graph of the trust fund ratios for the combined trust funds appears in figure II.D6.

Figure IV.B3.-Long-Range OASI and DI Trust Fund Ratios
[Asset reserves as a percentage of annual cost]

## 4. Summarized Income Rates, Summarized Cost Rates, and Actuarial Balances

Summarized values for the full 75-year period are useful in analyzing the program's long-range actuarial status over the period as a whole, both under current law and under proposed modifications to the law. All annual amounts included in a summarized value are present-value discounted to the valuation date. It is important to note that the actuarial balance indicates the solvency status of the fund only for the very end of the period.

Table IV.B5 presents summarized income rates, summarized cost rates, and actuarial balances for 25-year, 50-year, and 75-year valuation periods. Summarized income rates are the sum of the present value of non-interest income for a period (which includes scheduled payroll taxes, the projected income from the taxation of scheduled benefits, and reimbursements from the General Fund of the Treasury) and the starting trust fund asset reserves, expressed as a percentage of the present value of taxable payroll over the period. Under current law, the total OASDI payroll tax rate will remain at 12.4 percent in the future. In contrast, income from taxation of benefits, expressed as a percentage of taxable payroll, is expected to increase in most years of the long-range period for the reasons discussed on page 153. Summarized cost rates are the sum of the present value of cost for a period (which includes scheduled benefits, administrative expenses, net interchange with the Railroad Retirement program, and payments for vocational rehabilitation services for disabled beneficiaries) and the present value of the cost of reaching a target trust fund of 100 percent of annual cost at the end of the period, expressed as a percentage of the present value of taxable payroll over the period.

The actuarial balance for a valuation period is equal to the difference between the summarized income rate and the summarized cost rate for the period. An actuarial balance of zero for any period indicates that cost for the period could be met for the period as a whole (but not necessarily at all points within the period), with a remaining trust fund reserve at the end of the period equal to 100 percent of the following year's cost. A negative actuarial balance for a period indicates that the present value of income to the program plus the existing trust fund is less than the present value of the cost of the program plus the cost of reaching a target trust fund reserve of one year's cost by the end of the period. Generally, a trust fund is deemed to be adequately financed for a period as a whole if the actuarial balance is zero or positive, meaning that the reserves at the end of the period are at least
equal to annual cost. Note that solvency is possible at the end of the period with a small negative actuarial balance where reserves are still positive. ${ }^{1}$

Table IV.B5 contains summarized rates for the intermediate, low-cost, and high-cost assumptions. The low-cost and high-cost assumptions define a wide range of possibilities. Financial outcomes as good as the low-cost scenario or as bad as the high-cost scenario are unlikely to occur.

For the 25 -year valuation period, the OASDI program has an actuarial balance of -0.23 percent of taxable payroll under the low-cost assumptions, -2.28 percent under the intermediate assumptions, and -4.64 percent under the high-cost assumptions. These balances indicate that the program is not adequately financed for the 25-year valuation period under any of these three sets of assumptions.

For the 50-year valuation period, the OASDI program has actuarial balances of -0.21 percent under the low-cost assumptions, -3.06 percent under the intermediate assumptions, and -6.76 percent under the high-cost assumptions. These actuarial balances mean that the OASDI program is not adequately financed for the 50 -year valuation period under any of these three sets of assumptions.

For the entire 75 -year valuation period, the combined OASDI program has actuarial balances of -0.07 percent of taxable payroll under the low-cost assumptions, -3.50 percent under the intermediate assumptions, and -8.24 percent under the high-cost assumptions. These balances indicate that the combined OASDI program is not adequately financed for the 75-year valuation period under any of these three sets of assumptions.

Assuming the intermediate assumptions accurately capture future demographic, economic, and program-specific trends, solvency for the program over the next 75 years could be restored using a variety of approaches. For example, revenue could be increased in a manner equivalent to an immediate and permanent increase in the combined Social Security payroll tax rate from 12.40 percent to 15.73 percent (a relative increase of 26.9 percent), ${ }^{2}$ cost could be reduced in a manner equivalent to an immediate and permanent

[^13]reduction in scheduled benefits of 20.8 percent, or some combination of approaches could be used.
However, eliminating the actuarial deficit for the next 75 -year valuation period requires raising payroll taxes or lowering benefits by more than is required just to achieve solvency, because the actuarial deficit includes the cost of attaining a target trust fund equal to 100 percent of annual program cost by the end of the period. The actuarial deficit could be eliminated for the 75 -year period by increasing revenue in a manner equivalent to an immediate and permanent increase in the combined payroll tax from 12.40 percent to 15.90 percent (a relative increase of 28.2 percent), ${ }^{1}$ reducing cost in a manner equivalent to an immediate reduction in scheduled benefits of 21.6 percent, or some combination of approaches could be used.

Under the intermediate assumptions, the OASDI program has large annual deficits toward the end of the long-range period that reach 4.64 percent of payroll for 2098 (see table IV.B1). These large deficits indicate that annual cost continues to exceed non-interest income after 2098, so continued adequate financing would require larger changes than those needed to maintain solvency for the 75 -year period. Over the period extending through the infinite horizon, the actuarial deficit is 4.5 percent of payroll under the intermediate assumptions.

${ }^{\text {a }}$ Benefit payments scheduled to be paid on January 3 are actually paid on December 31 as required by the statutory provision for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. For comparability with the values for historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment each year.
Note: Components may not sum to totals because of rounding.

## 5. Open-Group Unfunded Obligation

Consistent with practice since 1965, this report focuses on a 75 -year opengroup valuation to evaluate the long-range actuarial status of the OASDI program. The open-group valuation includes non-interest income and cost for past, current, and future participants through the year 2098. The open-group unfunded obligation measures the adequacy of financing over the period as a whole for a program financed on a pay-as-you-go basis. On this basis, payroll taxes and scheduled benefits for all participants are included through 2098.

The open-group unfunded obligation increased from $\$ 22.4$ trillion shown in last year's report to $\$ 22.6$ trillion in this report. If there had been no changes in starting values, assumptions, laws, or methods for this report, then the open-group unfunded obligation would have increased to $\$ 23.2$ trillion
solely due to the change in the valuation period. This expected increase in the unfunded obligation occurs because: (1) the unfunded obligation is now discounted to January 1, 2024, rather than to January 1, 2023, which tends to increase the unfunded obligation by the annual nominal interest rate; and (2) the unfunded obligation now includes an additional year (2098). However, changes in the law, assumptions, methods, and starting values resulted in a net $\$ 0.6$ trillion decrease in the unfunded obligation.

The 75 -year unfunded obligation is equivalent to 3.32 percent of OASDI taxable payroll and 1.2 percent of GDP for 2024-98. ${ }^{1}$ These percentages were 3.42 and 1.2 , respectively, for last year's report. The 75 -year unfunded obligation as a percentage of taxable payroll is less than the actuarial deficit, because the unfunded obligation excludes the cost of having an ending target trust fund value.

The actuarial deficit was 3.61 percent of payroll in last year's report, and was expected to increase to a deficit of 3.67 percent of payroll solely due to the change in the valuation period. Changes in the law, assumptions, methods, and starting values combined to account for a 0.17 percentage point decrease (improvement) in the actuarial deficit to 3.50 percent of payroll. The actuarial deficit is 1.2 percent of GDP in this year's report, 0.1 percent lower than in last year's report.

As mentioned above, the open-group unfunded obligation expressed in dollars is lower than it would have been if only the valuation period had been changed. This net decrease occurred for a variety of reasons described in the next section, in particular changes in recent economic data and near-term assumptions, the change in the ultimate disability assumption, and changes in programmatic data and methods, partially offset by the change in the ultimate assumption for the total fertility rate.

Table IV.B6 presents the components and the calculation of the long-range (75-year) actuarial balance under the intermediate assumptions. The present value of future cost less future non-interest income over the long-range period, minus the amount of trust fund asset reserves at the beginning of the projection period, is $\$ 22.6$ trillion for the OASDI program. This amount is the 75-year "open-group unfunded obligation" (see row H). The actuarial deficit (which is the negative of the actuarial balance) combines this unfunded obligation with the present value of the ending target trust fund and expresses the total as a percentage of the present value of the taxable payroll for the period. The present value of future non-interest income minus cost,

[^15]plus starting trust fund reserves, minus the present value of the ending target trust fund, is $-\$ 23.8$ trillion for the OASDI program.

Table IV.B6.-Components of 75-Year Actuarial Balance and Unfunded Obligation Under Intermediate Assumptions

| Item | OASI | DI | OASDI |
| :---: | :---: | :---: | :---: |
| Present value as of January 1, 2024 (in billions): |  |  |  |
| A. Payroll tax revenue | \$72,228 | \$12,265 | \$84,493 |
| B. Reimbursements from general revenue. | 1 | a |  |
| C. Taxation of benefits revenue | 6,586 | 215 | 6,800 |
| D. Non-interest income ( $\mathrm{A}+\mathrm{B}+\mathrm{C}$ ) | 78,815 | 12,480 | 91,295 |
| E. Cost | 105,128 | 11,572 | 116,701 |
| F. Cost minus non-interest income (E-D) | 26,313 | -907 | 25,406 |
| G. Trust fund asset reserves at start of period | 2,641 | 147 | 2,788 |
| H. Open-group unfunded obligation (F-G) | 23,672 | -1,054 | 22,618 |

| J. Income minus cost, plus reserves at start of period, minus ending target trust fund ( $\mathrm{D}-\mathrm{E}+\mathrm{G}-\mathrm{I}=-\mathrm{H}-\mathrm{I}$ ) | -24,782 | 932 | -23,850 |
| K. Taxable payroll | 681,799 | 681,799 | 681,799 |

Percent of taxable payroll:
Actuarial balance ( $100 \times \mathrm{J} \div \mathrm{K}$ ) . . . . . . . . . . . . . . . . . . . . . . . . . -3.63 . 14 -3.50
${ }^{\mathrm{a}}$ Less than $\$ 0.5$ billion.
${ }^{\mathrm{b}}$ The calculation of the actuarial balance includes the cost of accumulating a target trust fund reserve equal to 100 percent of annual cost at the end of the period.
Note: Components may not sum to totals because of rounding.
Consideration of summary measures alone (such as the actuarial balance and open-group unfunded obligation) for a 75 -year period can lead to incorrect perceptions and to policy prescriptions that do not achieve sustainable solvency. These concerns can be addressed by considering the trend in trust fund ratios toward the end of the period. (See the discussion of "sustainable solvency" beginning on page 54.)

Another measure of trust fund finances, discussed in appendix F, is the infinite horizon unfunded obligation, which takes account of all annual balances, even those after 75 years. The extension of the time period past 75 years assumes that the current-law OASDI program and the demographic, economic, and program-specific trends used for the 75 -year projection continue indefinitely. This infinite horizon unfunded obligation is estimated to be 4.5 percent of taxable payroll or 1.4 percent of GDP. These percentages were 4.6 and 1.4 , respectively, for last year's report. Of course, the degree of uncertainty associated with estimates increases substantially for years further in the future.

## 6. Reasons for Change in Actuarial Balance From Last Year's Report

Table IV.B7 shows the effects of changes on the long-range actuarial balance under the intermediate assumptions, by category, between last year's report and this report.

Table IV.B7.-Reasons for Change in the 75-Year Actuarial Balance,
Based on Intermediate Assumptions
[As a percentage of taxable payroll]

| Item | OASI | DI | OASDI |
| :---: | :---: | :---: | :---: |
| Shown in last year's report: |  |  |  |
| Income rate. | 11.93 | 1.85 | 13.78 |
| Cost rate | 15.54 | 1.84 | 17.38 |
| Actuarial balance | -3.62 | . 01 | -3.61 |
| Changes in actuarial balance due to changes in: |  |  |  |
| Legislation / Regulation. | ${ }^{\text {a }}$ | ${ }^{\text {a }}$ | ${ }^{\text {a }}$ |
| Valuation period ${ }^{\text {b }}$ | -. 05 | -. 01 | -. 06 |
| Demographic data and assumptions . | -. 16 | -. 01 | -. 16 |
| Economic data and assumptions. | . 11 | . 02 | . 13 |
| Disability data and assumptions. | . 01 | . 11 | . 12 |
| Methods and programmatic data | . 07 | . 01 | . 08 |
| Total change in actuarial balance . | -. 02 | . 13 | . 11 |
| Shown in this report: |  |  |  |
| Actuarial balance | -3.63 | . 14 | -3.50 |
| Income rate. . | 11.95 | 1.85 | 13.80 |
| Cost rate. | 15.58 | 1.72 | 17.30 |

${ }^{\text {a }}$ Between -0.005 and 0.005 percent of taxable payroll.
${ }^{\mathrm{b}}$ The change in the 75 -year valuation period from last year's report to this report means that the 75 -year actuarial balance now includes the relatively large negative annual balance for 2098. This change in the valuation period results in a larger long-range actuarial deficit. The actuarial deficit includes the trust fund reserve at the beginning of the projection period.
Note: Components may not sum to totals because of rounding.
If the law, data, assumptions, and methods had all remained unchanged from last year's Trustees Report, the long-range OASDI actuarial balance would have decreased (worsened) by 0.06 percent of taxable payroll solely due to the change in the valuation period. However, as described below, projections in this report also reflect new data and changes in law, assumptions, and methods. These changes, including the change in the valuation period, combine to increase (improve) the long-range OASDI actuarial balance by 0.11 percentage point, from -3.61 percent of taxable payroll in last year's report to -3.50 percent in this report.

## Legislation/Regulation

Changes in law, regulations, and policy have a negligible effect on the longrange OASDI actuarial balance.

Since the last report, there have been continued judicial developments related to immigration policy. On September 13, 2023, the US District Court for the Southern District of Texas issued a decision on the Deferred Action for Childhood Arrivals (DACA) program, generally affirming a July 2021 district court order. As a result, the US Citizenship and Immigration Services maintained the approach they have been following, which is to not process first-time applications but to continue processing renewal applications.

## Actuarial Estimates

The estimates presented in last year's report reflected the assumption that the DACA program would be fully in effect, including processing of first-time applications, by the middle of 2023, consistent with the Administration's intent. Because of the continuing court challenges, the estimates in this year's report incorporate an additional assumed one-year delay in full implementation, to the middle of 2024. This one-year delay has a negligible effect on the actuarial balance.

## Valuation Period

As mentioned above, changing the 75-year valuation period from 2023 through 2097 for last year's report to 2024 through 2098 for this report decreases the projected long-range OASDI actuarial balance by 0.06 percent of taxable payroll. This decrease occurs because (1) the annual balances after 2023 are now discounted to January 1, 2024, rather than to January 1, 2023, and (2) the relatively large negative annual balance for 2098 is now included in this year's 75 -year projection period. Note that the actuarial balance calculation includes trust fund reserves at the beginning of the projection period. These reserves reflect the program's net financial flows for all past years, including 2023, up to the start of the valuation period.

## Demographic Data and Assumptions

New demographic data and changes in demographic assumptions combine to decrease (worsen) the long-range OASDI actuarial balance by 0.16 percent of taxable payroll.

One ultimate demographic assumption was changed for this year's report. The ultimate total fertility rate (TFR) was lowered from 2.0 children per woman to 1.9 children per woman, and at the same time, the year the ultimate TFR is reached was changed from 2056 to 2040. The Trustees believe that an incremental lowering of the ultimate TFR is warranted, consistent with recent surveys of birth expectations and the continued low level of the TFR in recent years. Contributing factors include lower TFRs in high immigrant source countries such as Mexico, increased utilization of more effective birth control, other societal changes including lower marriage rates, and possible concerns about economic opportunity for the future. This change in the level of the ultimate fertility assumption and the year in which it is reached decreases the actuarial balance by 0.10 percent of taxable payroll.

Updates to recent demographic data and near-term assumptions also result in significant changes in the long-range actuarial balance.

First, final birth data for calendar year 2022 and preliminary data for 2023 indicate that total fertility rates were slightly lower than the rates assumed in
last year's report for those years. Incorporating the updated data led to generally slightly lower birth rates during the transition period to the ultimate level, decreasing the actuarial balance by 0.03 percent of taxable payroll.

Second, updates to near-term mortality assumptions to reflect the effects of the COVID-19 pandemic increase the long-range actuarial balance by 0.01 percent of taxable payroll. Actual mortality data are now available for all age groups for calendar years 2020 through 2022. To account for the continuing effects of the pandemic in calendar years 2023 and 2024, adjustment factors are applied to the probabilities of death that would have been projected in the absence of the pandemic. Based on preliminary data available at the time assumptions for this report were set, these adjustment factors are somewhat higher for all age groups for 2023 compared to the factors used for last year's report. The factors assumed for 2024 are also above the factors used for last year's report. As in last year's report, projected death rates for years after 2024 are assumed to be unchanged from the levels that would have been projected in the absence of the pandemic.

Third, updates to data for mortality, the historical population, other-than-lawful permanent resident immigration, and divorce combine to decrease the actuarial balance by 0.03 percent of taxable payroll.

## Economic Data and Assumptions

New economic data and changes in economic assumptions, in combination, increase the long-range OASDI actuarial balance by 0.13 percent of taxable payroll.

The ultimate economic assumptions are unchanged for this year's report. However, updates to recent economic data and near-term assumptions result in significant changes in the long-range actuarial balance.

First, an update to educational attainment data caused an increase in the long-range actuarial balance of 0.02 percent of taxable payroll. The level of educational attainment affects the modeled labor force participation rates for ages 55 and older for men and 50 and older for women; as the level of educational attainment rises, participation rates tend to increase.

Second, historical OASDI covered employment for 2021 was somewhat higher, and its age distribution was different, than had been estimated for last year's report. OASDI covered employment for 2021 was significantly higher than previously estimated at the youngest and oldest working ages, and lower for men at early prime working ages. This data update and the resulting effects on employment and beneficiary levels in years after 2021 increase the actuarial balance by 0.05 percent of taxable payroll.

Other changes to historical data and near-term economic assumptions combine for a net increase in the actuarial balance of about 0.06 percent of taxable payroll. In particular, due to greater-than-anticipated economic growth through 2023, the Trustees increased the assumed level of labor productivity over the projection period. Together with the economic data updates described above, these economic changes increase the level of GDP by a total of about 3 percent over the projection period, excluding the eventual offsetting effects of the lower assumed fertility rate.

## Disability Data and Assumptions

New disability data and changes in disability assumptions combine to increase the long-range OASDI actuarial balance by 0.12 percent of taxable payroll.

Disabled-worker application and incidence rates dropped substantially from 2010 through 2019 before the pandemic and have fallen even further since then. Applications and incidence rates since 2013 have been well below expectations and are not consistent with an assumption of a full rise back to longer-term past historical averages. Based on this experience, the ultimate disability incidence rate was lowered for this report from 4.8 to 4.5 per thousand exposed. In addition, recent disability data and changes to the near-term disability incidence assumptions have been incorporated. These changes combine to increase the actuarial balance by 0.08 percent of payroll.

The changes to the ultimate and near-term disability incidence assumptions were also incorporated into the labor force participation model, leading to an additional increase in the long-range actuarial balance of 0.03 percent of taxable payroll. Specifically, the labor force model now uses this year's lower disability incidence assumptions and resulting lower disability prevalence projections. A decrease in disability prevalence increases the modeled labor force participation and employment rates.

## Methods and Programmatic Data

The projections in this report also reflect several methodological improvements and updates based on new program-specific data. These methodological changes, programmatic data updates, and interactions combine to increase the long-range OASDI actuarial balance by 0.08 percent of taxable payroll. Descriptions of five significant methodological changes and programmatic data updates follow.

First, the method used for projecting fertility rates during the transition period to the ultimate rate was modified to base the projections on trends in birth rates for each age relative to the birth rate at a base age of 30 for the
same year. This method produces more reasonable transition paths to the ultimate assumed rates by age group than the approach used in last year's report. This method improvement decreases the actuarial balance by 0.03 percent of taxable payroll.
The second significant change is related to the long-range model used to project the number of insured workers. This model constructs simulated work histories using past coverage rates, earnings distributions, and amounts required for crediting quarters of coverage, and develops them in a manner that replicates historical individual variations in work patterns. Data updates and related changes to improve the alignment of simulated fully insured rates with historical fully insured rates increase the actuarial balance by 0.04 percent of payroll.

Third, recent data and estimates provided by the Office of Tax Analysis at the Department of the Treasury indicate higher near-term and ultimate levels of revenue from income taxation of OASDI benefits than projected in last year's report. The increase in projected ratios of income tax on benefits to benefit amounts increases the actuarial balance by 0.03 percent of taxable payroll.
The fourth significant change is related to the sample used for the long-range model for projecting average benefit levels of retired-worker and disabledworker beneficiaries who become newly entitled for benefits. This model uses a large sample of 10 percent of all newly entitled retired-worker beneficiaries in a recent year. Data updates and a minor update to the methodology for projecting average benefit levels for women combine to increase the actuarial balance by 0.03 percent of payroll.

The fifth significant change is updating the post-entitlement benefit adjustment factors based on new programmatic data. Post-entitlement adjustment factors are used to account for changes in benefit levels, primarily due to differential mortality by benefit level and earnings after initial benefit entitlement. This data update decreases the actuarial balance by 0.02 percent of payroll.

In addition to these five methodological changes and programmatic data updates, changes in starting levels and projected levels of OASI and DI beneficiaries and benefit amounts over the first 10 years of the projection period, updating other programmatic data, other small methodological improvements, and interactions among the various method changes and updates to programmatic experience combine to increase the long-range actuarial balance by 0.03 percent of payroll.

Figure IV.B4.-OASDI Annual Balances: 2023 and 2024 Trustees Reports [As a percentage of taxable payroll, under intermediate assumptions]

Calendar year

Figure IV.B4 compares the annual balances for this report and the prior year's report for the combined OASDI program over the long-range ( 75 -year) projection period. The figure illustrates the annual effects of the changes described earlier in this section.
The projected annual balances in this year's report are generally higher (less negative) in years through 2077, primarily due to the changes in economic factors, disability assumptions, and methodological improvements described above, which have positive effects throughout the long-range period. Beginning in 2078, however, the annual balances are lower (more negative) in net, due to the change in the assumption for the ultimate total fertility rate, which has a negative effect beginning in the early 2060 's. For the full 75 -year projection period (2024-98), the annual balances average 0.13 percentage point higher in this year's report. For 2098, the projected annual deficit is 4.64 percent of taxable payroll in this report, compared to 4.36 percent in last year's report.

## V. ASSUMPTIONS AND METHODS UNDERLYING ACTUARIAL ESTIMATES

The future income and cost of the OASDI program will depend on many demographic, economic, and program-specific factors. Trust fund income will depend on how these factors affect the size and composition of the working population as well as the level and distribution of earnings. Similarly, program cost will depend on how these factors affect the size and composition of the beneficiary population as well as the general level of benefits.
The Trustees make basic assumptions for several of these factors based on analysis of historical trends, historical conditions, and expected future conditions. These factors include fertility, mortality, immigration, marriage, divorce, productivity, inflation, average earnings, unemployment, real interest rates, and disability incidence and termination. Other factors depend on these basic assumptions. These other, often interdependent, factors include total population, life expectancy, labor force participation, gross domestic product, and program-specific factors. Each year, the Trustees reexamine these assumptions and methods in light of new information and make appropriate revisions.

Future levels of these factors and their interrelationships are inherently uncertain. To address these uncertainties, this report uses three sets of assumptions, designated as intermediate (alternative II), low-cost (alternative I), and high-cost (alternative III). The intermediate set represents the Trustees' best estimate of the future course of the population and the economy as of the time assumptions were set in December 2023. With regard to the net effect on the actuarial status of the OASDI program, the low-cost set is more optimistic and the high-cost set is more pessimistic. The low-cost and high-cost sets of assumptions reflect significant potential changes in the interrelationships among factors, as well as changes in the values for individual factors.

While it is unlikely that all of the factors and interactions will differ in the specified directions from the intermediate values, many combinations of individual differences in the factors could have a similar overall effect. Outcomes with overall long-range cost as low as the low-cost scenario or as high as the high-cost scenario are very unlikely. This report also includes a section on sensitivity analysis, where factors are changed one at a time (see appendix D), and a section on stochastic projections, which provides a probability distribution of possible future outcomes, with most of the key factors being varied around the intermediate alternative (see appendix E).

Readers should interpret the estimates based on the three sets of alternative assumptions with care. These estimates are not specific predictions of the future financial status of the OASDI program. Rather, they are intended to provide a reasonable range of future income and cost.

All of the key demographic, economic, and program-specific assumptions reach their long-range ultimate values within the next 25 years. For extrapolations beyond the 75-year long-range period, the ultimate levels or trends reached by the end of the 75 -year period remain unchanged. The assumed ultimate values represent average annual experience or growth rates. Actual future values will exhibit fluctuations or cyclical patterns, as in the past.

At this time, there is no consensus on what the lasting effects of the COVID-19 pandemic on long-term demographic, economic, and programspecific trends will be. The Trustees continue to assume that the pandemic will have no significant net effect on most individual long-range ultimate assumptions.

The following sections briefly discuss the various assumptions and methods used in making the estimates of trust fund actuarial status, which are the focus of this report. ${ }^{1}$ There are, of course, many interrelationships among these factors that are important but are beyond the scope of this discussion.

## A. DEMOGRAPHIC ASSUMPTIONS AND METHODS

This section of the report provides a brief overview of the demographic historical data and the assumptions used for the projections.

## 1. Fertility Assumptions

Birth rates by single year of age, for girls and women aged 14 to $49,{ }^{2}$ are the basis for the fertility assumptions. These rates apply to the total number of women, across all marital statuses, in the midyear population at each age. Table V.A1 displays the historical and projected total fertility rates. ${ }^{3}$

Historically, birth rates in the United States have fluctuated widely. The total fertility rate decreased from 3.31 children per woman at the end of World

[^16]War I (1918) to 2.15 during the Great Depression (1936). After 1936, the total fertility rate rose to 3.68 in 1957 and then fell to 1.74 by 1976. After 1976, the total fertility rate rose above 2.00 by 1990 , where it generally remained through 2009, but it dropped below 1.90 for 2011 and has been at relatively low levels since then. It reached an all-time low of 1.64 for 2020 but went up slightly to 1.66 for 2021 and 2022.

The variations in the historical total fertility rate resulted from changes in many factors, including social attitudes, economic conditions, birth-control practices, and the racial/ethnic composition of the population. Since the baby-boom era (1946-65), women have had higher educational attainment, higher labor force participation, an older average age at first marriage, and a higher propensity to be unmarried. All of these factors are consistent with continued lower total fertility rates than those experienced during the babyboom era. It is still too early to tell whether the Supreme Court's 2022 decision in Dobbs v. Jackson Women's Health Organization and changes being made and considered in states regarding abortion policy will have a significant effect on future fertility rates. However, there are many factors that indicate that the ultimate total fertility rate may be lower than the average level since the end of the baby-boom era, including results from recent surveys of birth expectations, continued lower total fertility rates in recent years, lower total fertility rates in high-immigrant source countries such as Mexico, increased utilization of more effective birth control, other societal changes including lower marriage rates, and possible concerns about economic opportunity for the future. Therefore, the Trustees assume ultimate total fertility rates of $2.10,1.90$, and 1.60 children per woman for the low-cost, intermediate, and high-cost assumptions, respectively. These rates are 0.1 child per woman lower than the ultimate rates assumed in last year's report for each alternative.

For the intermediate assumptions, the projected total fertility rate gradually increases on a period (annual) basis through the year the ultimate period value is reached (2040). The assumed low-cost and high-cost total fertility rates trend away from the intermediate path, also reaching their ultimate period values in 2040. The ultimate period values were reached in 2056 in last year's report. The Trustees continue to assume that recent low rates of period fertility are, in part, indicative of a gradual shift to older ages of childbearing for younger birth cohorts. At the same time, reaching the ultimate total fertility rate sooner than it was reached in last year's report is consistent with the total fertility rate recovering to a lower ultimate value than it did in last year's report.

## 2. Mortality Assumptions

Mortality projections are developed assuming ultimate average annual percentage reductions in future mortality rates by age group and cause of death. The assumptions are used to estimate future central death rates by age group, sex, and cause of death.

Adjustments were made to the assumed death rates for 2023 and 2024 to account for the effects of the pandemic period. The table below shows the multiplicative factors that were applied to the probabilities of death that would have been projected in the absence of the pandemic. Factors for 2020 through 2022 are not necessary, as actual data are available.

| Year | Age 0 | Ages 1-14 | Ages 15-64 | Ages 65-84 | Ages 85 <br> and older |
| :---: | ---: | ---: | ---: | ---: | ---: |
| 2023 | 1.01 | 1.22 | 1.08 | 1.06 | 1.04 |
| 2024 | 1.00 | 1.06 | 1.02 | 1.02 | 1.01 |

Actual death rates for 2022 exceeded those projected in the 2023 report. Factors for 2023 are based on partial, provisional data through July and assumptions about the remainder of the year. Compared to the death rates used for last year's report, the factors in the table above result in higher total death rates in 2023 and 2024.

From the estimated central death rates, probabilities of death by single year of age and sex were calculated. Projected death rates for years after 2024 are unchanged from the levels that would have been projected in the absence of the pandemic, under the assumption that increased deaths from the residual effects of living through the pandemic (both physiological and psychological) will be roughly offset by decreased deaths that instead happened earlier (during the pandemic).

Historical death rates were calculated for years 1900 through 2022 for ages below 65 (and for all ages for years prior to 1968) using data from the National Center for Health Statistics (NCHS). ${ }^{1}$ For ages 65 and over, final Medicare data on deaths for years 1968 through 2020 and preliminary data for 2021 and 2022 were used. ${ }^{2}$ Death rates by cause of death were produced for all ages for years 1979-2022 using data from the NCHS. Note, however, that regressions used for the model projections do not include data for 2020 through 2022 due to the elevated death rates caused by COVID-19.

[^17]The total age-sex-adjusted death rate ${ }^{1}$ declined at an average annual rate of 1.02 percent between 1900 and 2019. Between 1979 and 2019, the period for which death rates were analyzed by cause, the total age-sex-adjusted death rate, for all causes combined, declined at an average rate of 0.86 percent per year.

Death rates have declined substantially in the U.S. since 1900, with rapid declines over some periods and slow or no improvement over the other periods. Many factors are responsible for historical reductions in death rates, including medical advances, increased availability of health-care services, and improvements in sanitation and nutrition. Historical death rates generally declined more slowly for older ages and more rapidly for children and infants than for the rest of the population. Between 1900 and 2019, the age-sex-adjusted death rate declined at an average rate of 0.78 percent per year for ages 65 and over, and 2.96 percent per year for ages under 15.

Mortality assumptions differ for the low-cost, intermediate, and high-cost scenarios. Throughout the projection period, the low-cost scenario contains annual percentage reductions that are smaller than those in the intermediate scenario, while those in the high-cost scenario are larger. The ultimate annual percentage reductions for each of the three alternatives are unchanged from last year's report.

The trends in the annual reductions in central death rates were calculated for the period from 2008 to 2019 for both the NCHS and Medicare data, by age group, sex, and cause of death. ${ }^{2}$ These trends are the starting rates of reduction for alternative II. For alternatives I and III, 50 and 150 percent of the starting rates of reduction are used, respectively. These annual rates of reduction, by alternative, are assumed to transition rapidly from the starting rates of reduction until they reach the ultimate annual rates of reduction assumed for 2048 and later.

Table V.A1 contains historical and projected age-sex-adjusted death rates for the total population (all ages), for ages under 65, and for ages 65 and over. Age-sex adjustment eliminates the effect of a changing distribution of population by age and sex. Under the intermediate assumptions, projected total age-sex-adjusted death rates are slightly lower than the rates in last year's report after 2024. These changes result from incorporating updated population exposures under age 65 starting in 2010 to be consistent with the latest Census estimates.

[^18]The projected average annual rate of decline between 2023 and 2098 for the total age-sex-adjusted death rate is about 0.35 percent for alternative I, 0.82 percent for alternative II, and 1.35 percent for alternative III. ${ }^{1}$ In keeping with the patterns observed in the historical data, the assumed future rates of decline are greater for younger ages than for older ages, but to a substantially lesser degree than in the past. Accordingly, the projected age-sexadjusted death rates for ages 65 and over decline between 2023 and 2098 at average annual rates of about 0.32 percent for alternative I, 0.74 percent for alternative II, and 1.19 percent for alternative III. The projected age-sexadjusted death rates for ages under 15 decline between 2023 and 2098 at average annual rates of about 0.61 percent for alternative I, 1.61 percent for alternative II, and 3.04 percent for alternative III.

Demographers express a wide range of views on the likely rate of future decline in death rates. For example, some believe that the long-standing historical tendency for mortality to decline more slowly at the oldest ages will cease in the future. Others believe that biological factors, social factors, and limitations on health care spending may slow future rates of decline in mortality.

[^19]Table V.A1.-Fertility and Mortality Assumptions, ${ }^{\text {a }}$ Calendar Years 1940-2100

| Calendar year | Totalfertility rate ${ }^{\text {b }}$ | Age-sex-adjusted death rate ${ }^{\mathrm{c}}$ per 100,000 |  |  |

${ }^{\text {a }}$ This table contains basic assumptions along with key summary values that are derived from basic assumptions.
${ }^{\mathrm{b}}$ The total fertility rate for any year is the average number of children that would be born to a woman if she were to experience, at each age of her life, the birth rate observed in, or assumed for, the selected year, and if she were to survive the entire childbearing period.
${ }^{c}$ Based on the enumerated total population as of April 1, 2010, if that population were to experience the death rates by age and sex observed in, or assumed for, the selected year.
${ }^{\mathrm{d}}$ Estimated using final data for ages below 65 and preliminary data for ages 65 and older.
${ }^{\mathrm{e}}$ Estimated using preliminary data.
${ }^{\mathrm{f}}$ Estimated using partial-year selected state data.
g Estimated, intermediate alternative.

## 3. Immigration Assumptions

Projections of the total Social Security area population reflect assumptions for the following four immigration flows:

- Lawful permanent resident (LPR) immigration: The flow of persons who enter the Social Security area and are granted LPR status, or who are already in the Social Security area and adjust their status to become LPRs. ${ }^{1}$
- Legal emigration: The flow of LPRs and citizens who leave the Social Security area population.
- Other-than-LPR immigration: The flow of persons who enter the Social Security area and stay to the end of the year without being granted LPR status, such as undocumented immigrants, and foreign workers and students entering with temporary visas.
- Other-than-LPR emigration: The flow of other-than-LPR immigrants who leave the Social Security area population or who adjust their status to become LPRs.

Net LPR immigration is the difference between LPR immigration and legal emigration. Net other-than-LPR immigration is the difference between other-than-LPR immigration and other-than-LPR emigration. Total net immigration refers to the sum of net LPR immigration and net other-than-LPR immigration.

Immigration assumptions differ for the low-cost, intermediate, and high-cost scenarios. The low-cost scenario includes higher annual net immigration and the high-cost scenario includes lower annual net immigration. Table V.A2 contains historical and projected levels of various immigration flows.

LPR immigration has increased significantly since World War II, due to various factors and legislative changes, including the Immigration Act of 1965 and the Immigration Act of 1990.

LPR new arrival immigration levels dropped significantly in the initial years of the COVID - 19 pandemic and are estimated to be about 280,000 persons lower in 2020, 250,000 persons lower in 2021, and 51,000 persons lower in 2022 than would have been expected in the absence of the pandemic. The LPR new arrival immigration level for 2023 is assumed to be 681,000 persons under the low-cost alternative, 631,000 persons under the

[^20]
## Assumptions and Methods

intermediate alternative, and 581,000 persons under the high-cost alternative. LPR new arrival immigration levels for 2024-26 are assumed to be higher than would have been assumed in the absence of the pandemic, fully making up for the lower levels in 2020-22. These pandemic effects on LPR new arrival immigration levels, both the lower levels in 2020-22 and the higher levels in 2024-26, are slightly larger in magnitude than the assumed pandemic effects in last year's report.

For the intermediate alternative, the ultimate level of annual LPR immigration, which includes residents who adjust their status to become LPRs, is assumed to be $1,050,000$ persons for 2027 and later. For alternative I, ultimate annual LPR immigration is assumed to be 1,250,000 persons for 2027 and later, and for alternative III, ultimate annual LPR immigration is assumed to be 850,000 persons for 2027 and later. The ultimate levels of LPR immigration are unchanged from last year's report.

The assumed ratios of annual legal emigration to LPR immigration are 20, 25 , and 30 percent for alternatives I, II, and III, respectively. This range is consistent with the limited historical data for legal emigration from the Social Security area. These ratios are unchanged from last year's report. Under the intermediate alternative, by combining the ultimate annual LPR immigration and legal emigration assumptions, ultimate annual net LPR immigration is about 788,000 persons. Ultimate annual net LPR immigration is $1,000,000$ persons for the low-cost scenario and 595,000 persons for the high-cost scenario.

The estimated number of other-than-LPR immigrants residing in the Social Security area and the annual level of other-than-LPR immigration were affected significantly by the economic recession of 2007-09. Although other-than-LPR immigration was greatly reduced during the economic downturn and immediate years thereafter, it returned to higher levels for most years from 2014 through 2019, reflecting a recovery from levels experienced during the recession. The COVID-19 pandemic began to affect other-thanLPR immigration in 2020; the estimated level of other-than-LPR immigration is about 458,000 persons lower in 2020 and 77,000 persons lower in 2021 than would have been estimated in the absence of the pandemic.

The Trustees assume that the pandemic will continue to affect other-thanLPR immigration in years 2023 through 2024. The other-than-LPR immigration levels for 2022 are assumed to be the same as would have been assumed in the absence of the pandemic. Other-than-LPR immigration levels for 2023 and 2024 are assumed to be higher than would have been assumed in the absence of the pandemic, fully making up for the lower levels in 2020 and 2021. These pandemic effects on other-than-LPR immigration levels, both
the lower levels in 2020-21 and the higher levels in 2023-24, are all smaller in magnitude than the assumed pandemic effects in last year's report.

The ultimate annual levels of other-than-LPR immigration are $1,350,000$ persons for alternative II, $1,850,000$ persons for alternative I, and 850,000 persons for alternative III. These ultimate levels are unchanged from those used in last year's report. The ultimate levels are attained in 2025 for all three alternatives.

Emigration from the other-than-LPR immigrant population includes those who leave the Social Security area and those who adjust their status to become LPRs. This other-than-LPR immigrant population is highly mobile and far more likely to leave the Social Security area than is the citizen or LPR population. However, as other-than-LPR immigrants stay in the country for longer periods of time, they generally become less likely to leave the country.

Under the intermediate assumptions, the total annual number of other-thanLPR immigrants who leave the Social Security area averages about 427,000 through the 75 -year projection period. The ultimate annual number of other-than-LPR immigrants who adjust status to become LPRs is assumed to be 450,000 for the intermediate assumptions and is unchanged from last year's report. The total annual number of other-than-LPR emigrants averages about 586,000 for the low-cost scenario and 267,000 for the high-cost scenario through the 75 -year projection period. The ultimate annual number of people adjusting status to LPR status is assumed to be 550,000 persons for the lowcost scenario and 350,000 persons for the high-cost scenario; these levels are unchanged from last year's report.

The projected size of the other-than-LPR immigrant population grows substantially under the intermediate assumptions, from about 16.3 million by the end of 2024 to about 35.6 million by the end of 2098 . This growth reflects the excess of annual immigration over the combined annual numbers of emigrants (including adjustments of status) and deaths that occur within the other-than-LPR immigrant population.

Under the intermediate assumptions, the projected levels of net other-thanLPR immigration gradually decrease over time. Because the projected number of other-than-LPR immigrants leaving the Social Security area is based on rates of departure, an increase in the number of other-than-LPR immigrants residing in the Social Security area results in an increase in the number who emigrate out of the area. All other components of net other-thanLPR immigration are assumed to be stable after 2024, and thus do not contribute toward any change in annual net other-than-LPR immigration. Under

## Assumptions and Methods

the intermediate assumptions, the projected average annual level of net other-than-LPR immigration over the 75 -year projection period is about 476,000 persons. Projected average annual net other-than-LPR immigration is about 718,000 persons under the low-cost assumptions and 237,000 persons under the high-cost assumptions.

The projected average annual level of total net immigration (LPR and other-than-LPR, combined) is about $1,269,000$ persons per year during the 75 -year projection period under the intermediate assumptions. Projected average annual total net immigration is about $1,723,000$ persons under the low-cost assumptions and about 837,000 persons under the high-cost assumptions.

Demographers express a wide range of views about the future course of immigration for the United States. Some believe that net immigration will increase substantially in the future. Others believe that potential immigrants may be increasingly attracted to other countries, that the number of potential immigrants may be lower due to lower birth rates in many countries, or that changes in the law or enforcement of the law will reduce immigration.

${ }^{\text {a }}$ This table contains basic assumptions along with key summary values that are derived from basic assumptions.
${ }^{\mathrm{b}}$ Historical other-than-LPR immigration and emigration estimates depend on a residual method. The Office of the Chief Actuary developed these estimates, as well as the resulting other-than-LPR January 1 stock estimates, for years through 2000. For years 2001 and later, the residual method uses stock estimates. For 2001 through 2004, the stock is set to values that linearly grade from the 2000 stock estimate to the 2005 stock estimate. Stock estimates are developed by the Office of the Chief Actuary, based on the latest methods used by DHS.
${ }^{\text {c }}$ Estimates include persons who attained LPR status under the special one-time provisions of the Immigration Reform and Control Act of 1986.
${ }^{\mathrm{d}}$ Adjustments of status are a positive for net LPR immigration and a negative for net other-than-LPR immigration.
${ }^{e}$ Estimated.
${ }^{\mathrm{f}}$ Estimated, intermediate alternative.
Note: Components may not sum to totals because of rounding.

## 4. Total Population Estimates

The starting Social Security area population for December 31, 2021, is derived from the Census Bureau's estimate of the residents of the 50 States and D.C. and U.S. Armed Forces overseas. Adjustments are made to reflect mortality assumptions for the aged population since 2020 that are consistent with Medicare and Social Security data, net immigration assumptions for the aged population since 2020, estimates of the net undercount in the 2020 census, inclusion of U.S. citizens living abroad (including residents of U.S. territories), and inclusion of non-citizens living abroad who are insured for Social Security benefits. The Office of the Chief Actuary projects the Social Security area population by age, sex, and marital status for December 31 of each year from 2022 through 2098 by combining the assumptions for future fertility, mortality, and immigration with assumptions for marriage and divorce. Previous sections of this chapter present the assumptions for future fertility, mortality, and immigration. Assumptions for future rates of marriage and divorce reflect historical data from the National Center for Health Statistics, the Census Bureau, and selected individual States.

This report presents a July 1 (i.e., midyear) population for each year, which is derived from surrounding December populations. Table V.A3 shows the historical and projected population for July 1 by broad age group, for the three alternatives. It also shows the aged and total dependency ratios (see table footnotes for definitions).

Table V.A3.-Social Security Area Population on July 1 and Dependency Ratios, Calendar Years 1945-2100

${ }^{\text {a }}$ Ratio of the population at ages 65 and over to the population at ages 20-64.
${ }^{\mathrm{b}}$ Ratio of the population at ages 65 and over and the population under age 20 to the population at ages 20-64.
${ }^{\text {c }}$ Estimated.
${ }^{\mathrm{d}}$ Estimated, intermediate alternative.
Notes:

1. Historical data are subject to revision.
2. Components may not sum to totals because of rounding.

## 5. Life Expectancy Estimates

Life expectancy, or the average remaining number of years expected prior to death, is an additional way to summarize the Trustees' mortality assumptions. This report includes life expectancy both at birth and at age 65, in two different forms (period and cohort), which are useful for separate purposes.

- Period life expectancy at a selected age for a particular year incorporates the actual or expected death rates at the selected age and each older age for that year. It is a useful summary statistic for illustrating the overall level of the death rates at or above the given age experienced in a single year. Period life expectancy for a particular year provides an individual's expected average remaining lifetime at a selected age, assuming no change in death rates after that year. Table V.A4 presents historical and projected life expectancy calculated on a period basis.
- Cohort life expectancy does not incorporate death rates for a single year, but for the series of years in which the individual will actually reach each succeeding age if he or she survives. Cohort life expectancy provides the expected average remaining lifetime for an individual at a selected age in a particular year, using actual or expected future death rates for the selected age and all succeeding ages. Table V.A5 presents historical and projected life expectancy calculated on a cohort basis. Cohort life expectancy is generally greater than period life expectancy for a given year because: (1) death rates at any age generally decline over time; and (2) cohort life expectancy uses death rates for future years, while period life expectancy uses death rates only for the given year.

Life expectancy at a given age reflects death rates at that and all older ages. Period life expectancy is somewhat related to the age-sex-adjusted death rate discussed in section V.A.2. However, life expectancy places far greater weight on death rates at relatively younger ages (those at or just above the given age) than those at relatively older ages. Therefore, changes in death rates at young ages, particularly in infancy, affect life expectancy at birth to a much greater degree than changes in death rates at older ages. It is important to keep this concept in mind when considering trends in life expectancy.

${ }^{\mathrm{a}}$ The period life expectancy at a given age for a given year is the average remaining number of years expected prior to death for a person at that exact age, born on January 1, using the mortality rates for that year over the course of his or her remaining life.
${ }^{\mathrm{b}}$ Estimated using final data for ages below 65 and preliminary data for ages 65 and older.
${ }^{\mathrm{c}}$ Estimated using preliminary data.
${ }^{\mathrm{d}}$ Estimated, intermediate alternative.

| 2090 | 87.3 | 90.5 | 23.0 | 25.1 | 80.6 | 85.0 | 19.8 | 22.3 | 93.6 | 95.4 | 26.5 | 28.2 |
| 2095 | 87.6 | 90.7 | 23.2 | 25.3 | 80.7 | 85.1 | 19.9 | 22.4 | 93.9 | 95.6 | 26.8 | 28.5 |
| 2100 | 87.9 | 90.9 | 23.4 | 25.5 | 80.9 | 85.2 | 20.0 | 22.5 | 94.2 | 95.9 | 27.2 | 28.7 |

${ }^{\text {a }}$ The cohort life expectancy at a given age for a given year is the average remaining number of years expected prior to death for a person at that exact age, born on January 1, using the mortality rates for the series of years in which the individual will actually reach each succeeding age if he or she survives.
${ }^{\mathrm{b}}$ Cohort life expectancy at birth for those born in the calendar year is based on a combination of actual, estimated, and projected death rates for birth years 1940 through 2021. For birth years after 2021, these values depend on estimated and projected death rates.
${ }^{\text {c }}$ Age 65 cohort life expectancy for those attaining age 65 in calendar years 1940 through 2020 is based on a combination of actual, estimated, and projected death rates. After 2020, these values depend on estimated and projected death rates.

## B. ECONOMIC ASSUMPTIONS AND METHODS

The three alternative sets of economic assumptions are intended to provide a reasonable range for estimating the future financial status of the trust funds. The intermediate assumptions reflect stronger-than-expected economic growth in 2023 and the Trustees' expectation of a brief period of slower growth in 2024-25, steady growth thereafter, and their best estimates for other economic parameters. The low-cost assumptions represent a more optimistic outlook, maintaining a higher level of economic output, stronger longterm economic growth, and relatively optimistic levels for other parameters. The high-cost assumptions represent a more pessimistic scenario with a recession in 2024-25, slower economic growth in the long term, and relatively pessimistic levels for other parameters.

Actual economic data were generally available through the third quarter of 2023 at the time the assumptions for this report were set. Those data indicate that economic activity reached a peak in the fourth quarter of $2019 .{ }^{1} \mathrm{~A}$ recession started in the first quarter of 2020 due to the precipitous decline in economic activity in March resulting from the onset of the COVID-19 pandemic, continuing into April, leading to the gross domestic product (GDP) in the second quarter of 2020 being more than 9 percent below the peak in the fourth quarter of 2019, expressed in constant 2017 dollars. GDP recovered rapidly, surpassing the fourth quarter 2019 peak in the first quarter of 2021. In the third quarter of 2023 , GDP was about 7 percent above the previous peak.

Under the intermediate assumptions, the economy is estimated to be 1.5 percent above its sustainable trend level of output in the third quarter of 2023 and then grows relatively slowly, gradually falling slightly below the sustainable trend level in 2025 through 2026. Growth is stronger thereafter, with GDP reaching and stabilizing at the sustainable trend level in the second quarter of 2028. The sustainable trend level of GDP is almost 3 percent higher for 2029 through 2045 in this year's report than in the 2023 report; after 2045 that difference decreases due to slower assumed population growth in this year's report. Under the low-cost assumptions, GDP is estimated to be at a higher sustainable trend level of output in the third quarter of 2023 but grows slightly slower than the sustainable trend level through the first quarter of 2024, returning to the higher sustainable trend level of output by the second quarter of 2025 . Under the high-cost assumptions, the sustain-

[^21]
## Assumptions and Methods

able trend level is lower, and GDP is estimated to be 2.5 percent above it in the third quarter of 2023. GDP falls to 2.5 percent below that lower sustainable trend level in the second quarter of 2025 and then recovers to the sustainable trend level by the fourth quarter of 2031. Complete economic cycles have little effect on the long-range estimates of financial status of the trust funds, so the assumptions do not include cycles beyond the short-range period (2024 through 2033).

The key economic assumptions underlying the three sets of projections of the future financial status of the OASI and DI Trust Funds are discussed in the remainder of this section.

## 1. Productivity Assumptions

Total U.S. economy productivity is defined as the ratio of real GDP to hours worked by all workers. ${ }^{1}$ The rate of change in total-economy productivity is a major determinant of the growth of average earnings. Over the last six complete economic cycles (1969-73, 1973-79, 1979-90, 1990-2001, 2001-07, and 2007-19, measured peak to peak), the annual increase in totaleconomy productivity averaged $2.64,1.06,1.39,1.84,2.15$, and 1.20 percent, respectively. For the period from 1969 to 2019 , covering those last six complete economic cycles, the annual increase in total-economy productivity averaged 1.59 percent.

The assumed ultimate annual increase in total-economy productivity is 1.93, 1.63, and 1.33 percent for the low-cost, intermediate, and high-cost assumptions, respectively. ${ }^{2}$ These rates of increase are unchanged from the 2023 report.

The average annual rate of change in total-economy productivity from 2019 (the end of the last complete economic cycle) to 2023 is estimated to be 1.40 percent. For the intermediate assumptions, the annual rate of change in productivity is assumed to be 1.13 percent for 2024 and 1.28 percent for 2025, to average 1.61 percent for 2026 through 2030, and to reach its ultimate value of 1.63 percent for 2031 and thereafter. For the low-cost assumptions, the annual rate of change in productivity is assumed to be 1.19 percent for 2024 , to average 1.95 percent for 2025 through 2028, and to reach its ultimate value of 1.93 percent for 2029 and thereafter. For the high-cost assumptions, the assumed recession lowers the annual rate of change in productivity

[^22]to -0.03 percent for 2024 and 0.74 percent for 2025 . The growth rate rebounds to an average of 1.90 percent for 2026 through 2027 , averages 1.43 percent for 2028 through 2033, and stabilizes at its ultimate value of 1.33 percent for 2034 and thereafter. The combined effect of data revisions, new data for 2023, and more optimistic near-term projections increased the average productivity growth rate from 2022 to 2033 under the intermediate assumptions from 1.39 percent in the 2023 report to 1.48 percent for this report.

## 2. Price Inflation Assumptions

Changes in the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI) directly affect the OASDI program through the automatic cost-of-living benefit increases. Changes in the GDP price index (GDP deflator) affect the nominal levels of GDP, wages, self-employment income, average earnings, and taxable payroll. For a given real rate of growth in average earnings, a higher price inflation rate immediately results in a higher nominal rate of growth in both earnings and revenues, while the resulting added growth in nominal benefit levels occurs with a delay, causing an overall increase (improvement) in the actuarial balance. Similarly, a lower price inflation rate causes an overall decrease in the actuarial balance.

The annual increase in the CPI averaged 4.91, 8.54, 5.30, 2.73, 2.63, and 1.73 percent over the economic cycles 1969-73, 1973-79, 1979-90, 1990-2001, 2001-07, and 2007-19, respectively. ${ }^{1}$ The annual increase in the GDP deflator averaged $5.04,7.54,4.62,2.08,2.52$, and 1.56 percent for the respective economic cycles. For the period from 1969 to 2019 , covering the last six complete economic cycles, the annual increase averaged 3.89 percent for the CPI and 3.44 percent for the GDP deflator. The annual rate of change for 2020, which was affected by the recession, was 1.21 percent for the CPI and 1.34 percent for the GDP deflator. During the subsequent recovery, aggregate demand increased while supply was constrained, leading to 2021 and 2022 growth rates of 5.26 and 8.46 percent for the CPI and 4.57 and 7.05 percent for the GDP deflator, respectively. The estimated annual growth rates for 2023 are still elevated but are significantly lower than in 2021 and 2022, at 3.86 percent for the CPI and 3.76 percent for the GDP deflator.

[^23]
## Assumptions and Methods

The assumed ultimate annual increase in the CPI is $3.00,2.40$, and 1.80 percent for the low-cost, intermediate, and high-cost assumptions, respectively. These values are unchanged from the 2023 report.

For the intermediate assumptions, the annual rate of change in the CPI is 2.76 percent for 2024, 2.32 percent for 2025, and reaches the ultimate growth rate of 2.40 percent for 2026 and thereafter. For the low-cost assumptions, the annual rate of change in the CPI is 2.90 percent for 2024, 2.92 percent for 2025 , and reaches its ultimate growth rate of 3.00 percent for 2026 and thereafter. For the high-cost assumptions, the annual rate of change in the CPI is 2.79 percent for 2024, 1.91 percent for 2025, and reaches its ultimate growth rate of 1.80 percent for 2026 and thereafter.

The annual increase in the GDP deflator differs from the annual increase in the CPI because the two indices are constructed using different computational methods and coverage (the set of goods and services used in the measurement). The difference between the rate of change in the CPI and the rate of change in the GDP deflator is called the price differential in this report. For the period including 1969 through 2019, covering the last six complete economic cycles, the average annual price differential was 0.47 percentage point. The annual price differential was -0.13 percentage point for 2020 , 0.69 percentage point for 2021, 1.41 percentage points for 2022 , and is estimated to be 0.10 percentage point for 2023.

The fluctuations in the price differential for 2020-23 primarily reflect a decline, subsequent increase, and eventual relative stabilization in oil prices, as well as price increases concentrated in consumer goods categories during the economic recovery of 2020-22. Changes in oil prices affect the CPI much more than the GDP deflator because oil comprises a much larger share of U.S. consumption than of U.S. production. Oil prices are assumed to grow at a relatively stable rate in the future. For the intermediate assumptions, the price differential is -0.04 percentage point for 2024, 0.22 percentage point for 2025 , and 0.35 percentage point for 2026 and later.

The assumed ultimate price differential is $0.25,0.35$, and 0.45 percentage point for the low-cost, intermediate, and high-cost alternative, respectively. Varying the ultimate projected price differential across alternatives recognizes the historical variation in this measure. Accordingly, the assumed ultimate annual increase in the GDP deflator is 2.75 ( 3.00 less 0.25 ), 2.05 (2.40 less 0.35 ), and 1.35 ( 1.80 less 0.45 ) percent for the low-cost, intermediate, and high-cost alternative, respectively. The ultimate price differentials for the three alternatives are unchanged from the 2023 report.

## 3. Average Earnings Assumptions

The size of the taxable payroll-the main source of the OASDI program's income-for each year depends primarily on the nominal earnings in OASDI covered employment, which is the product of covered employment ${ }^{1}$ for the year and average covered earnings for the year. The level of average covered earnings also affects the future level of average benefits. In addition, the average reported annual wage in the U.S. economy determines the national average wage index (AWI). Under the automatic adjustment provisions in the law, the growth in the AWI affects the contribution and benefit base, certain parameters used in the OASDI benefit formula, and certain other program parameters. ${ }^{2}$

The projected growth rate in average annual covered earnings and in the AWI are derived from the projected growth rate in average U.S. earnings. The level of average U.S. earnings is defined as the ratio of the sum of total U.S. wages and net proprietors' income to the sum of average weekly U.S. civilian employment and Armed Forces. The growth rate in average U.S. earnings for any period is equal to the combined growth rates for total U.S. economy productivity, average hours worked per week, the ratio of earnings to total labor compensation (which includes fringe benefits), the ratio of total labor compensation to GDP, and the GDP deflator.

The average annual change in average hours worked per week was -0.20 percent over the last six complete economic cycles covering the period from 1969 to 2019. The annual change in average hours worked averaged $-0.87,-0.53,-0.09,0.11,-0.47$, and -0.05 percent over the economic cycles 1969-73, 1973-79, 1979-90, 1990-2001, 2001-07, and 2007-19, respectively. From 2019 to 2023, the first four years after the peak of the last complete cycle, the average annual change in average hours worked per week is estimated to be a decrease of 0.01 percent.

The assumed ultimate annual rate of change for average hours worked per week is $0.05,-0.05$, and -0.15 percent for the low-cost, intermediate, and high-cost assumptions, respectively. These values are unchanged from the 2023 report.

The average annual change in the ratio of earnings to total labor compensation was -0.15 percent from 1969 to 2019. Data from BEA indicate that the

[^24]most significant component of this change was the relative increase in the cost of employer-sponsored group health insurance (ESGHI) for wage workers, followed by the increase in employer contributions to social insurance (as statutory payroll tax rates increased between 1970 and 1990), and, to a lesser extent, an increase in employer contributions to retirement plans. Assuming that the level of total employee compensation is not affected by the amount of non-wage compensation, such as ESGHI, any increase or decrease in the cost of non-wage compensation leads to a commensurate decrease or increase in wages. Projections of future ratios of earnings to total labor compensation follow this principle.

The average annual rate of change in the ratio of wages to employee compensation was -0.17 percent from 1969 to 2019. The average annual rate of change in this ratio increased sharply to 0.44 percent for the period 2019 to 2023, in part due to the unusual effects of the pandemic-induced recession. The average annual rate from 2023 to 2033 is assumed to be about 0.01 , -0.10 , and -0.15 percent for the low-cost, intermediate, and high-cost assumptions, respectively. For the last 65 years of the long-range period, from 2033 to 2098 , the annual rate is assumed to be $0.00,-0.10$, and -0.20 percent for the low-cost, intermediate, and high-cost assumptions, respectively. The rates for the last 65 years are unchanged from the 2023 report. Under the intermediate assumptions, the ratio of wages to employee compensation declines from 0.829 for 2023 to 0.769 for 2098.

Because earnings and compensation are the same for self-employed workers, the ratio of earnings to total labor compensation includes self-employment income both in the numerator and in the denominator. As a result, the rate of change in the ratio of earnings to total labor compensation (which, under the intermediate assumptions, averages -0.08 percent from 2033 to 2098) is slightly higher (i.e., less negative) than the rate of change in the ratio of wages to employee compensation.

The ratio of total labor compensation (i.e., employee compensation and net proprietors' income) to GDP varies over the economic cycle and with changes in the relative sizes of different sectors of the economy. Over the last six complete economic cycles from 1969 to 2019, this ratio averaged 0.621 , but it was lower over the last complete cycle from 2007 to 2019, averaging 0.605 . The ratio increased to 0.618 for 2020 , but declined in subsequent years, and is estimated to be 0.589 for 2023. It is projected to gradually rise to reach 0.628 by 2033 under the intermediate assumptions. For years after 2033, the relative sizes of different sectors of the economy are assumed to
remain about constant, ${ }^{1}$ and therefore the ratio of total labor compensation to GDP remains at about the 2033 level for each set of assumptions.

For the intermediate assumptions, the projected average annual growth rate in average nominal U.S. earnings from 2023 to 2033 is 4.28 percent. The projected average annual growth rate from 2033 to 2098 is 3.58 percent, which reflects the assumed ultimate annual growth rates of 1.63 percent for productivity, -0.05 percent for average hours worked, 2.05 percent for the GDP deflator, and -0.08 percent for the ratio of earnings to total labor compensation. Over the same period, the projected average annual growth rate in average nominal U.S. earnings is 4.79 percent for the low-cost assumptions and 2.37 percent for the high-cost assumptions.

The average annual wage in OASDI covered employment (often referred to as the "average covered wage") is defined as the total wages and salaries paid in OASDI covered employment during the year, divided by the number of workers who worked in OASDI covered employment at any time during the year. Over long periods, the average annual growth rate in the average covered wage is expected to be very close to the average annual growth rate in average U.S. earnings. The estimated annual rate of change in the average covered wage is 3.85 percent for 2023 under the intermediate assumptions. From 2023 to 2033, the annual rate of change in the average covered wage averages $5.41,4.16$, and 3.07 percent for the low-cost, intermediate, and high-cost assumptions, respectively. The projected average annual growth rate in the average covered wage from 2033 to 2098 is $4.79,3.56$, and 2.34 percent for the low-cost, intermediate, and high-cost assumptions, respectively.

## 4. Assumed Real Wage Growth

For the period from 1969 to 2019 , covering the last six complete economic cycles, the annual real (i.e., inflation-adjusted) growth rate in the average covered wage averaged 0.77 percent, the result of averages of $0.98,0.03$, $0.46,1.42,0.80$, and 0.76 percent over the economic cycles 1969-73, 1973-79, 1979-90, 1990-2001, 2001-07, and 2007-19, respectively. The real wage increased 1.55 percent for 2020, a year which included the pandemicinduced recession and the beginning of the ensuing recovery. It then increased 3.60 percent for 2021 , during the continuing rapid recovery from the recession, decreased 2.59 percent for 2022, and is estimated to decrease

[^25]0.01 percent for 2023 under the intermediate assumptions, primarily due to the high recent inflation rate.

For the period 2033 to 2098, the projected average annual real wage growth rate in OASDI covered employment is $1.74,1.14$, and 0.53 percent for the low-cost, intermediate, and high-cost assumptions, respectively. The average annual real wage growth rates are unchanged from the 2023 report for the intermediate and low-cost alternatives, and slightly lower for the high-cost alternative.

Under the intermediate assumptions, the annual real wage growth rate is projected to be 0.99 percent for 2024, 1.20 percent for 2025 , to average 1.85 percent from 2025 to 2033, and to average 1.14 percent from 2033 to 2098. For the low-cost assumptions, the annual real wage growth rate is 2.03 percent for 2024 , averages 2.39 percent from 2024 to 2033 , and averages 1.74 percent from 2033 to 2098 . For the high-cost assumptions, the real wage growth rate is -0.93 percent for 2024 and -0.38 percent for 2025 . It then averages 1.76 percent from 2025 to 2031, 1.08 percent from 2031 to 2033, and 0.53 percent from 2033 to 2098.

Table V.B1.—Principal Economic Assumptions

| Calendar year | Annual percentage change ${ }^{\text {a }}$ in- |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Productivity (Total U.S. economy) | $\begin{aligned} & \text { GDP } \\ & \text { price } \\ & \text { index } \end{aligned}$ | Average hours worked per week | Earnings as a percent of total labor ompensation | Average annual wage in covered employment |  | ConsumerPriceIndex |
|  |  |  |  |  | Nominal | Real |  |
| Historical data: |  |  |  |  |  |  |  |
| 5-year periods: |  |  |  |  |  |  |  |
| 1960 to 1965 | 3.24 | 1.36 | 0.19 | -0.18 | 3.22 | 1.95 | 1.24 |
| 1965 to 1970 | 2.04 | 4.02 | -. 66 | -. 30 | 5.84 | 1.55 | 4.23 |
| 1970 to 1975 | 2.07 | 6.61 | -. 87 | -. 49 | 6.58 | -. 17 | 6.76 |

## 5. Labor Force, Employment, and Unemployment Projections

Employment is a fundamental component of economic output (GDP), taxable payroll, and the determination of OASDI benefit eligibility and benefit levels. U.S. employment is projected in two components: the size of the labor force (those employed or seeking employment) and the unemployment rate (the proportion of those in the labor force who are not employed). Table V.B2 provides the historical and projected rates of change in employment, which follow from the rates of change in the labor force, adjusted for the varying unemployment rates from year to year.

The model used by the Office of the Chief Actuary projects the civilian labor force by age, sex, marital status, and presence of children. Projections of the labor force participation rates reflect changes in disability prevalence, educational attainment, marriage patterns, the average level of Social Security retirement benefits, the state of the economy, and life expectancy.

The annual rate of growth in the size of the labor force decreased from an average of about 2.6 percent during the 1969-73 economic cycle and 2.7 percent during the $1973-79$ cycle to 1.7 percent during the 1979-90 cycle, 1.2 percent during the 1990-2001 cycle, 1.1 percent during the 2001-07 cycle, and 0.5 percent during the 2007-19 cycle. From 2019 to 2023, during the current (incomplete) economic cycle, labor force growth averaged 0.6 percent per year, which combines the fall in the labor force during the pandemic-induced recession of 2020 and the growth in the labor force in 2021-23. Going forward, labor force growth is projected to be 1.0 percent in 2024, average 0.6 percent per year from 2024 to 2029, and average 0.4 percent per year from 2029 to 2033. The long-term growth rate in the labor force is expected to remain subdued due to a slowing of growth in the working-age population-a consequence of the baby-boom generation reaching retirement ages and succeeding lower-birth-rate cohorts reaching working ages. Under the intermediate assumptions, the labor force is projected to increase by an average of 0.3 percent per year from 2033 to 2098.

Labor force participation rates are projected with a model that uses demographic and economic assumptions specific to each alternative. More optimistic economic assumptions in the low-cost alternative are consistent with higher labor force participation rates, while demographic assumptions in the low-cost alternative (such as slower improvement in longevity) are consistent with lower labor force participation rates. These economic and demographic influences have largely offsetting effects. Therefore, the projected labor force participation rates do not vary substantially across alternatives.

Historically, labor force participation rates reflect trends in demographics and pensions. Between the mid-1960s and the mid-1980s, labor force participation rates at ages 55 and over declined for men but were fairly stable for women. During this period, the baby-boom generation reached working age and more women entered the labor force. This increasing supply of labor allowed employers to offer attractive early retirement options. Between the mid-1980s and the mid-1990s, participation rates at ages 55 and over roughly stabilized for men and increased for women. Since the mid-1990s, however, participation rates for both sexes at ages 55 and over have generally risen.

Many economic and demographic factors, including longevity, disability prevalence, the business cycle, incentives for retirement in Social Security and private pensions, education, and marriage patterns, will influence future labor force participation rates. The Office of the Chief Actuary models some of these factors explicitly. To model the effects of other factors related to increases in life expectancy, projected participation rates are adjusted upward for mid-career and older ages to reflect projected increases in life expec-
tancy. For the intermediate projections, this adjustment increases the total labor force by 3.0 percent for 2098.

For men and boys age 16 and over, the projected age-adjusted labor force participation rate ${ }^{1}$ for 2098 is $70.9,70.7$, and 70.3 percent for the low-cost, intermediate, and high-cost assumptions, respectively. For women and girls age 16 and over, the projected age-adjusted labor force participation rate for 2098 is $61.5,61.3$, and 61.2 percent for the low-cost, intermediate, and highcost assumptions, respectively. These age-adjusted labor force participation rates for 2098 are higher under all three alternatives than the age-adjusted rates for 2022 of 68.4 percent for men and boys and 57.1 percent for women and girls (based on actual age-specific rates published by the Bureau of Labor Statistics), primarily due to the Trustees' projected increases in life expectancy, as well as the rise in educational attainment for women.

The aggregate civilian unemployment rates are presented in table V.B2. For years through 2033, the table presents aggregate civilian rates without adjustment for the changing age-sex distribution of the population. For years after 2033, the table presents age-sex-adjusted rates, using the age-sex distribution of the 2020 civilian labor force. Age-sex-adjusted rates allow for more meaningful comparisons across longer time periods.

The aggregate civilian unemployment rate reflects the projected levels of unemployment for various age-sex groups of the population. Each group's unemployment rate gradually approaches an assumed stable value within the first ten years of the projection period for all alternatives, and thus the age-sex-adjusted civilian unemployment rate reaches its ultimate assumed value within the first ten years of the projection period.

The assumed ultimate age-sex-adjusted unemployment rate is $3.5,4.5$, and 5.5 percent for the low-cost, intermediate, and high-cost assumptions, respectively. These values are unchanged from the 2023 report. ${ }^{2}$ Under the intermediate assumptions, as economic growth slows to approach the sustainable long-term trend, the unemployment rate increases gradually from 3.6 percent for 2023 to 4.5 percent for 2026 and thereafter. Under the lowcost assumptions, the unemployment rate is projected to rise to 3.7 percent for 2024 , and then decline to the ultimate unemployment rate of 3.5 percent for 2025 and thereafter. Under the high-cost assumptions, due to the assumed

[^26]economic recession, the unemployment rate increases to 6.5 percent for 2026, with the age-sex-adjusted rate then gradually decreasing to the ultimate unemployment rate of 5.5 percent for 2032 and thereafter. ${ }^{1}$

## 6. Gross Domestic Product Projections

The value of real GDP is equal to the product of three components: (1) productivity (i.e., output per hour worked), (2) average weekly total employment, ${ }^{2}$ and (3) average hours worked per week, times 52. Consequently, the growth rate in real GDP is equal to the combined growth rates for productivity, total employment, and average hours worked. For the period from 1969 to 2019, which covers the last six complete economic cycles, the average annual growth in real GDP was 2.76 percent, combining average growth rates of 1.59 percent for productivity, 1.35 percent for total employment, and -0.20 percent for average hours worked $(1.0276=1.0159 \times 1.0135 \times 0.9980)$. The real GDP growth rate was -2.2 percent for $2020,5.8$ percent for 2021, 1.9 percent for 2022 , and is estimated to be 2.4 percent for 2023 under the intermediate assumptions.
For the intermediate assumptions, the average annual growth in real GDP is 2.0 percent from 2023 to 2033, combining the average growth rates of 1.54 percent for productivity, 0.50 percent for total employment, and -0.02 percent for average hours worked. The projected average annual growth in real GDP of 2.0 percent from 2023 to 2033 is slightly lower than the underlying sustainable trend rate of 2.1 percent over the same period, because the economy is estimated to be slightly above the sustainable trend in 2023. After 2033, the annual growth in real GDP follows the sustainable trend rate and averages 1.9 percent, which combines the projected ultimate annual growth rate of 1.63 percent for productivity, average annual growth rate of 0.32 percent for total employment, and the ultimate annual growth rate of -0.05 percent for average hours worked per week. The projected growth rate of real GDP is lower than the past average growth rate mainly because the working-age population is expected to grow more slowly than in the past.
For the low-cost assumptions, the annual growth in real GDP averages 2.8 percent from 2023 to 2033 and 2.6 percent from 2033 to 2098. For the

[^27]
## Assumptions and Methods

high-cost assumptions, the annual growth in real GDP averages 1.4 percent from 2023 to 2033 and 1.1 percent from 2033 to 2098.

## 7. Interest Rates

Table V.B2 presents average annual nominal and real interest rates for newly issued trust fund securities. The nominal rate is the average of the nominal interest rates for special U.S. Government obligations issuable to the trust funds in each of the 12 months of the year. Interest for these securities is compounded semiannually, or at redemption if sooner. The real interest rate is defined as the annual yield rate for investments in these securities divided by the annual rate of growth in the CPI for the first year after issuance. The real rate shown for each year reflects the actual realized (historical) or expected (future) real yield on securities issuable in the prior year.

To develop a reasonable range of assumed ultimate future real interest rates for the three alternatives, the Office of the Chief Actuary examined historical experience for the last six complete economic cycles. For the period from 1969 to 2019 , the real interest rate averaged 2.4 percent per year. The real interest rate averaged $1.6,-1.0,5.1,4.1,2.0$, and 0.8 percent per year over the economic cycles 1969-73, 1973-79, 1979-90, 1990-2001, 2001-07, and $2007-19$, respectively. The assumed ultimate real interest rate is 2.8 percent, 2.3 percent, and 1.8 percent for the low-cost, intermediate, and high-cost assumptions, respectively. These ultimate rates are unchanged from the 2023 report; however, they are reached later for all three alternatives. In this year's report, the real interest rate reaches its ultimate level in 2037 for the low-cost assumptions, 2041 for the intermediate assumptions, and 2041 for the highcost assumptions, whereas ultimate levels were reached by 2033 for all three alternatives in last year's report.

The average annual nominal interest rate was approximately 3.0 percent for securities newly issuable in 2022, with the effective annual yield also rounding to 3.0 percent for securities held for a full year. The CPI rose from 2022 to 2023 by approximately 3.9 percent. Consistent with these values, the annual real interest rate for 2023 was -0.8 percent. From 2023 to 2033, projected nominal interest rates depend on changes in economic conditions and in the CPI. When combined with the ultimate CPI assumptions of 3.0, 2.4, and 1.8 percent, the assumed ultimate real interest rates produce an ultimate nominal interest rate of 5.8 percent for the low-cost assumptions, 4.7 percent for the intermediate assumptions, and 3.6 percent for the high-cost assumptions. These nominal rates for newly issued trust fund securities reach their ultimate levels in 2036 for the low-cost assumptions, 2040 for the intermediate assumptions, and 2040 for the high-cost assumptions. In last year's report, the ultimate levels were reached by 2032 for all three alternatives.

${ }^{\text {a }}$ The Office of the Chief Actuary adjusts the civilian unemployment rates for 2034 and later to the age-sex distribution of the civilian labor force in 2020. For years through 2033, the values are the aggregate rates without adjustment for the changing age-sex distribution.
${ }^{\mathrm{b}}$ For rows with a single year listed, the value is the annual percentage change from the prior year. For rows with a range of years listed, the value is the compounded average annual percentage change.
${ }^{\mathrm{c}}$ The U.S. civilian labor force.
${ }^{\mathrm{d}}$ Total U.S. military and civilian employment.
${ }^{\mathrm{e}}$ The value of the total output of goods and services in 2017 dollars.
${ }^{\mathrm{f}}$ The average of the nominal interest rates, compounded semiannually, for special public-debt obligations issuable to the trust funds in each of the 12 months of the year.
g The realized or expected annual real yield for each year on securities issuable in the prior year
${ }^{\mathrm{h}}$ Greater than -0.05 and less than 0.05 percent.
${ }^{\mathrm{i}}$ Economic cycles are shown from peak to peak, except for the last cycle, which is not yet complete.
j Estimated values for 2023 vary slightly by alternative and are shown for the intermediate assumptions.

## C. PROGRAM-SPECIFIC ASSUMPTIONS AND METHODS

The Office of the Chief Actuary at the Social Security Administration uses a set of models to project future income and cost under the OASDI program. These models rely not only on the demographic and economic assumptions described in the previous sections, but also on a number of program-specific assumptions and methods. Values of many program parameters change from year to year as prescribed by formulas set out in the Social Security Act. These program parameters affect the level of payroll taxes collected and the level of benefits paid. The office uses complex models to project the numbers of future workers covered under OASDI and the levels of their covered earnings, as well as the numbers of future beneficiaries and the expected levels of their benefits. The following subsections provide descriptions of these program-specific assumptions and methods.

## 1. Automatically Adjusted Program Parameters

The Social Security Act requires that certain parameters affecting the determination of OASDI benefits and taxes be adjusted annually to reflect changes in particular economic measures. Formulas prescribed in the law, applied to reported statistics, change these program parameters annually. The law bases these automatic adjustments on measured changes in the national average wage index (AWI) and the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI). ${ }^{1}$ This section shows values for program parameters adjusted using these indices from the time that these adjustments became effective through 2033. Projected values for future years depend on the economic assumptions described in the preceding section of this report.

Tables V.C1 and V.C2 present the historical and projected values of the CPIbased benefit increases, the AWI series, and the values of many of the wageindexed program parameters. Each table shows projections under the three alternative sets of assumptions. Table V.C1 includes:

- The annual cost-of-living benefit increase percentages. The automatic cost-of-living adjustment provisions in the Social Security Act specify increases in OASDI monthly benefits based on increases in the CPI. Volatility in oil prices has resulted in substantial volatility in cost-of-living adjustments over the last two decades. A large cost-of-living adjustment for December 2008 was followed by no cost-of-living adjustments for December 2009 and December 2010. More recent volatility in oil

[^28]prices again affected the CPI, resulting in no cost-of-living adjustment for December 2015. Cost-of-living adjustments resumed in December 2016. All three sets of assumptions include annual cost-of-living adjustments for all future years.

- The annual levels of and percentage increases in the AWI. Under section 215(b)(3) of the Social Security Act, Social Security benefit computations index taxable earnings (for most workers first becoming eligible for benefits in 1979 or later) using the AWI for each year after 1950. This procedure converts a worker's past earnings to approximately average-wage-indexed equivalent values near the time of his or her benefit eligibility. Other program parameters presented in this section that are subject to the automatic-adjustment provisions also rely on the AWI.
- The wage-indexed contribution and benefit base. For any year, the contribution and benefit base is the maximum amount of earnings subject to the OASDI payroll tax and creditable toward benefit computation. The Social Security Act defers any increase in the contribution and benefit base if there is no cost-of-living adjustment effective for December of the preceding year. There was no increase in the contribution and benefit base for 2010, 2011, or 2016 because there was no cost-of-living adjustment for the immediate prior December in each case. Under all three sets of assumptions, the contribution and benefit base is projected to increase for all future years.
- The wage-indexed retirement earnings test exempt amounts. The exempt amounts are the annual amount of earnings below which beneficiaries do not have benefits withheld. A lower exempt amount applies for years prior to the year of attaining normal retirement age. A higher exempt amount applies beginning with the year in which a beneficiary attains normal retirement age. Starting in 2000, the retirement earnings test no longer applies beginning with the month of attaining normal retirement age. The Social Security Act defers any increase in these exempt amounts if there is no cost-of-living adjustment effective for December of the preceding year. There was no increase in these exempt amounts for 2010, 2011, or 2016 because there was no cost-of-living adjustment for the immediate prior December. Under all three sets of assumptions, the exempt amounts increase for all future years.

${ }^{\text {a }}$ Effective with benefits payable for June in each year 1975-82, and for December in each year after 1982.
${ }^{\mathrm{b}}$ See table VI.G6 for projected dollar amounts of the AWI for years beyond the last year of this table.
${ }^{\text {c }}$ Public Law 95-216 specified amounts for 1978-81. Public Law 101-239 changed the indexing procedure and caused slightly higher bases after 1989.
${ }^{\mathrm{d}}$ Normal retirement age. See table V.C3 for specific values.
${ }^{\mathrm{e}}$ In 1955-82, the retirement earnings test did not apply at ages 72 and over. In 1983-99, the test did not apply at ages 70 and over. Beginning in 2000, the test does not apply beginning with the month of normal retirement age attainment. In the year of normal retirement age attainment, the higher exempt amount applies to earnings prior to the month of normal retirement age attainment. Public Law 95-216 specified amounts for 1978-82. Public Law 104-121 specified amounts for 1996-2002.
${ }^{f}$ Originally determined as 2.4 percent. Pursuant to Public Law 106-554, effectively 2.5 percent.
g Actual amount, as determined under automatic-adjustment provisions.

Table V.C2 shows values for other wage-indexed parameters. The table provides historical values from 1978, when indexing of the amount of earnings required for a quarter of coverage first began, through 2024, and also shows projected values through 2033. These other wage-indexed program parameters are:

- The bend points in the formula for computing the primary insurance amount (PIA) for workers who reach age 62, become disabled, or die in a given year. As figure V.C1 illustrates, these two bend points define three ranges in a worker's average indexed monthly earnings (AIME). The formula for the worker's PIA multiplies a 90,32 , or 15 percent factor by the portion of the worker's AIME that falls within the three respective ranges, and then adds the resulting products together.

Figure V.C1.—Primary-Insurance-Amount Formula for Those Newly Eligible in 2024

- The bend points in the formula for computing the maximum total amount of monthly benefits payable based on the earnings record of a retired or deceased worker (maximum family benefit). As figure V.C2 illustrates, these three bend points define four ranges in a worker's PIA. The formula for the maximum family benefit multiplies a $150,272,134$, or 175 percent factor by the portion of the worker's PIA that falls within the four respective ranges, and then adds the resulting products together.

Figure V.C2.-OASI Maximum-Family-Benefit Formula for Those Newly Eligible in 2024

- The amount of earnings required in a year to earn a quarter of coverage $(Q C)$. The number and timing of QCs earned determines an individual's insured status-the basic requirement for benefit eligibility under OASDI.
- The old-law contribution and benefit base-the contribution and benefit base that would have been in effect without enactment of the 1977 amendments. This old-law base is used in determining special-minimum benefits for certain workers who have many years of low earnings in covered employment. Since 1986, the calculation of OASDI benefits for certain workers who are eligible to receive pensions based on noncovered employment uses the old-law base. In addition, the Railroad Retirement program and the Employee Retirement Income Security Act of 1974 use the old-law base for certain purposes.

## Assumptions and Methods

${ }^{\mathrm{a}}$ The formula to compute a PIA is: (1) $90 \%$ of AIME below the first bend point, plus (2) $32 \%$ of AIME in excess of the first bend point but not in excess of the second, plus (3) $15 \%$ of AIME in excess of the second bend point. The bend points are determined based on the first year a beneficiary becomes eligible for benefits.
${ }^{\mathrm{b}}$ The formula to compute an OASI family maximum is: (1) $150 \%$ of PIA below the first bend point, plus (2) $272 \%$ of PIA in excess of the first bend point but not in excess of the second, plus (3) $134 \%$ of PIA in excess of the second bend point but not in excess of the third, plus (4) $175 \%$ of PIA in excess of the third bend point. This formula also determines family maximums for disabled-worker beneficiaries first eligible after 1978 and entitled before July 1980.
${ }^{\mathrm{c}}$ Contribution and benefit base that would have been in effect without enactment of the Social Security Amendments of 1977. Public Law 101-239 changed the indexing procedure and caused slightly higher bases after 1989.
${ }^{\mathrm{d}}$ No provision in law for this amount in this year.
${ }^{\mathrm{e}}$ Amount specified by Social Security Amendments of 1977.
In addition to the economic factors that affect the determination of OASDI benefits, there are certain legislated changes that affect current and future benefit amounts. Two such changes are the scheduled increases in the normal retirement age and in the delayed retirement credits. Table V.C3 shows the scheduled changes in these parameters and the resulting effects on benefit levels expressed as a percentage of PIA.

Table V.C3.-Legislated Changes in Normal Retirement Age and Delayed Retirement

| Year of birth | Year of attainment of age 62 | Normal retirement age (NRA) | Credit for each year of delayed retirement after NRA (percent) | Benefit, as a percentage of PIA, beginning at age - |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 2. Covered Employment

Projections of the total U.S. civilian labor force and unemployment rate (see table V.B2) are based on Bureau of Labor Statistics definitions from the Current Population Survey (CPS). These projections represent the average weekly number of employed and unemployed persons, age 16 and over, in the U.S. in a calendar year. Covered employment for a calendar year is defined as the total number of persons who have any OASDI covered earnings (that is, earnings subject to the OASDI payroll tax) at any time during that year. For those age 16 and over, projected covered employment is the sum of age-sex groups, each reflecting the growth projected for the group's total U.S employment and average weeks worked per year. ${ }^{1}$ For the shortrange period, the age-sex-adjusted average weeks worked declines slightly as the age-sex-adjusted unemployment rate rises to its ultimate assumed value of 4.5 percent. After 2033, the average weeks worked for each age-sex group

[^29]is assumed to remain constant. The projection method also accounts for changes in non-OASDI-covered employment and the increase in coverage of Federal civilian employment as a result of the 1983 Social Security Amendments. It also reflects changes in the number and employment status of other-than-LPR immigrants residing within the Social Security coverage area, such as undocumented immigrants and foreign workers and students with temporary visas.

The covered-worker rate is the ratio of OASDI covered workers to the Social Security area population. For men and boys age 16 and over, the projected age-adjusted covered-worker rates ${ }^{1}$ for 2098 are $66.8,66.8$, and 66.7 percent for the low-cost, intermediate, and high-cost assumptions, respectively. For women and girls age 16 and over, the projected age-adjusted covered-worker rates for 2098 are $65.6,65.0$, and 64.7 percent for the low-cost, intermediate, and high-cost assumptions, respectively. An important factor in the variation among the projected rates for the three alternatives is the portion of the men and women in the population that is projected to be other-than-LPR immigrants. For men and boys, the intermediate projected rate for 2098 is lower than the 2022 age-adjusted rate of 68.5 percent primarily due to the projected increase in the portion of the Social Security area population that consists of other-than-LPR immigrants. For women and girls, the intermediate projected rate for 2098 is higher than the 2022 age-adjusted rate of 63.8 percent because the projected increase in the age-adjusted labor force participation rate more than offsets the projected increase in the portion of the population that will be other-than-LPR immigrants.

## 3. Insured Population

Eligibility for worker benefits under the OASDI program requires some threshold level of work in covered employment. A worker satisfies this requirement by his or her accumulation of quarters of coverage (QCs). Prior to 1978 , a worker earned one QC for each calendar quarter in which he or she earned at least $\$ 50$. In 1978, when annual earnings reporting replaced quarterly reporting, the amount required to earn a QC (up to a maximum of four per year) was set at $\$ 250$. As specified in the law, the Social Security Administration has adjusted this amount each year since then according to changes in the AWI. Its value in 2024 is $\$ 1,730$.

There are three types of insured status that a worker can earn under the OASDI program. The number and recency of QCs earned determine each

[^30]
## Assumptions and Methods

status. A worker is fully insured when his or her total number of QCs is greater than or equal to the number of years elapsed after the year of attainment of age 21 (but not less than six). After a worker has accumulated 40 QCs, he or she remains permanently fully insured. A worker is disability insured if he or she is: (1) a fully insured worker who has accumulated 20 QCs during the 40-quarter period ending with the current quarter, (2) a fully insured worker aged 24-30 who has accumulated QCs during one-half of the quarters elapsed after the quarter of attainment of age 21 and up to and including the current quarter, or (3) a fully insured worker under age 24 who has accumulated six QCs during the 12-quarter period ending with the current quarter. A worker is currently insured when he or she has accumulated six QCs during the 13-quarter period ending with the current quarter. Periods of disability reduce the number of quarters required for insured status, but not below the minimum of six QCs.

There are many types of benefits payable to workers and their family members under the OASDI program. A worker must be fully insured to be eligible for a primary retirement benefit and for his or her spouse or children to be eligible for auxiliary retirement benefits. A deceased worker must have been either currently insured or fully insured at the time of death for his or her children (and their mother or father) to be eligible for benefits. If there are no eligible surviving children, the deceased worker must have been fully insured at the time of death for his or her surviving spouse to be eligible. A worker must be disability insured to be eligible for a primary disability benefit and for his or her spouse or children to be eligible for auxiliary disability benefits.

The Office of the Chief Actuary estimates the fully insured population, as a percentage of the Social Security area population, by single year of age and sex starting in 1969. The short-range model extrapolates the historical trend in these rates from data in the Continuous Work History Sample (CWHS). The model uses information on quarters of coverage earned due to employment covered by Social Security derived from tabulations of the CWHS. The model also uses historical administrative data on beneficiaries in force and estimated historical mortality rates. The model combines this information to estimate the proportion of individuals who were alive and fully insured as of the end of each historical year. Using projected mortality rates and covered workers, the model extrapolates these rates into the future and applies them to the historical and projected population to arrive at the fully insured population by age and sex through the end of the short-range period.

The long-range fully insured model uses 30,000 simulated work histories for each sex and birth cohort, representing everyone except the other-than-LPR
immigrant population. ${ }^{1}$ For the other-than-LPR immigrant population, the model generates substantially lower percentages attaining fully insured status. The model constructs simulated work histories using past coverage rates, earnings distributions, and amounts required for crediting QCs, and develops them in a manner that replicates historical individual variations in work patterns. The probability of covered employment in any year is assumed to be higher for those who have worked more consistently in the recent past. Model parameters are selected so that simulated fully insured percentages are consistent with the fully insured percentages estimated by the short-range model for the recent historical period.

The Office of the Chief Actuary estimates the disability insured population, as a percentage of the fully insured population, by age and sex starting in 1969. The office bases historical values on a tabulation of the disability insured population from the CWHS and estimates of the fully insured population. The short-range model projects these percentages by using the relationship between the historical percentages and covered-worker rates. The long-range model projects these percentages by using the same simulated work histories used to project the fully insured percentages. The long-range model makes additional adjustments to the model simulations in order to bring the disability insured percentages in the historical and short-range periods into close agreement with those estimated from the CWHS and the shortrange model.

The office does not project the currently insured population because the number of beneficiaries who are entitled to benefits based solely on currently insured status has been very small recently and is likely to remain small in the future.

Using these insured models, the percentage of the Social Security area population aged 62 and over that is fully insured is projected to change from its estimated level of 87.9 for December 31, 2021, to $85.8,87.6$, and 90.1 for December 31, 2100, under the low-cost, intermediate, and high-cost alternatives, respectively. Over the projection period, the percentages for both men and women change significantly. The percentage for men declines, reflecting, in part, increases in the percent of the population that is classified as other-than-LPR immigrants and is thus less likely to have earnings reported and credited to them. The percentage for women increases, reflecting the past substantial growth in the employment of younger cohorts of women. Under the intermediate assumptions, for example, the percentage for men

[^31]decreases from 92.9 to 86.3 , and the percentage for women increases from 83.7 to 88.7 .

## 4. Old-Age and Survivors Insurance Beneficiaries

The Office of the Chief Actuary projects the number of OASI beneficiaries for each type of benefit separately by the sex of the worker on whose earnings the benefits are based and by the age of the beneficiary. For the longrange period, the office also projects the number of beneficiaries by marital status for several types of benefits. The office uses two separate models in making these projections. The short-range model makes projections during the first 10 years of the projection period and the long-range model makes projections thereafter.

The short-range model develops the number of retired-worker beneficiaries by applying award rates to the aged fully insured population, excluding those already receiving retired-worker, disabled-worker, aged-widow(er), or agedspouse benefits, and by applying termination rates to the number of retiredworker beneficiaries.

The long-range model projects the number of retired-worker beneficiaries who were not previously converted from disabled-worker beneficiary status as a percentage of the exposed population. ${ }^{1}$ For age 62 , the model projects this percentage by using a linear regression based on the historical relationship between this percentage, the employment rate ${ }^{2}$ at age 62 , and the number of months from age 62 to normal retirement age. The percentage for ages 70 and over is nearly 100 because delayed retirement credits cannot be earned after age 70. The long-range model projects the percentage for each age 63 through 69 based on historical experience with an adjustment for changes in the portion of the primary insurance amount that is payable at each age of entitlement. The model adjusts these percentages for ages 62 through 69 to reflect changes in the normal retirement age.

The long-range model calculates the number of retired-worker beneficiaries previously converted from disabled-worker beneficiary status using an extension of disabled-worker death rates by age, sex, and duration.

The Office of the Chief Actuary estimates the number of aged-spouse beneficiaries, excluding those who are also receiving a retired-worker benefit, from the population projected by age and sex. Benefits of aged-spouse beneficia-

[^32]ries depend on the earnings records of their husbands or wives, who are referred to as "earners." The short-range model projects insured aged-spouse beneficiaries in conjunction with the retired-worker beneficiaries. This model projects uninsured aged-spouse beneficiaries by applying award rates to the aged uninsured male or female population and by applying termination rates to the population already receiving such benefits.

The long-range model estimates aged-spouse beneficiaries separately for those married and divorced. The model projects the number of married agedspouse beneficiaries, by age and sex, by applying a series of factors to the number of spouses, aged 62 and over, in the population. These factors are the probabilities that the spouse and the earner meet all of the conditions of eligibility-that is, the probabilities that: (1) the earner is 62 or over, (2) the earner is insured, (3) the earner is receiving benefits, (4) the spouse is not receiving a benefit for the care of an entitled child, (5) the spouse is either not insured or is insured but not receiving benefits, and (6) the spouse is not eligible to receive a significant government pension based on earnings from noncovered employment. To calculate the estimated number of aged-spouse beneficiaries, the model applies a projected prevalence rate to the resulting number of spouses. Due to the Bipartisan Budget Act of 2015, for those turning age 62 in 2016 and later, deemed filing now applies to all retired workers and spouses even after initial entitlement, regardless of age. Thus, spouses who are insured are no longer eligible to delay their retired-worker benefit while receiving an aged-spouse benefit. ${ }^{1}$

The long-range model estimates the number of divorced aged-spouse beneficiaries, by age and sex, by applying the same factors to the number of divorced persons aged 62 and over in the population, with three differences. First, the model applies a factor to reflect the probability that the earner (former spouse) is still alive. If the former spouse is not alive, the person may be entitled to a divorced widow(er) benefit. Second, the model applies a factor to reflect the probability that the marriage to the former spouse lasted at least 10 years. Third, the model does not apply factor (3) in the previous paragraph because, effective January 1985, a divorced person is generally no longer required to wait for the former spouse to receive benefits.

The Office of the Chief Actuary bases the projected numbers of children under age 18 , and students aged 18 and 19 , who are eligible for benefits as children of retired-worker beneficiaries, on the projected number of children in the population. The short-range model develops the number of entitled

[^33]
## Assumptions and Methods

children by applying award rates to the number of children in the population who have two living parents and by applying termination rates to the number of children already receiving benefits.

The long-range model projects separately the number of entitled children by sex of the earner parent. For each age under 18 , the model multiplies the projected number of children with a parent aged 62 and over by the ratio of the number of retired workers aged 62 to 71 to the number of members of the population aged 62 to 71 . For student beneficiaries, the model multiplies the number of children aged 18 and 19 in the population by the probabilities that: (1) the parent is alive, aged 62 or over, insured, and receiving a retiredworker benefit; and (2) the child is attending high school.

The Office of the Chief Actuary projects the number of disabled children, aged 18 and over, of retired-worker beneficiaries from the adult population. The short-range model applies award rates to the population and applies termination rates to the number of disabled children already receiving benefits. The long-range model projects the number of disabled children in a manner similar to that used for student children except for a factor that reflects the probability of being disabled before age 22 .

The short-range model develops the number of spouses of retired workers, who are entitled to spouse benefits because they are caring for a child who is under age 16 or disabled, by applying award rates to the number of awards to children of retired workers and by applying termination rates to the number of young spouses with a child in their care who are already receiving benefits. The long-range model projects the number of young-spouse beneficiaries with a child in their care as a proportion of the number of child beneficiaries of retired workers, including projected changes in average family size.

The Office of the Chief Actuary projects the number of aged-widow(er) beneficiaries, excluding those who are also receiving a retired-worker benefit, from the population by age and sex. The short-range model projects fully insured aged-widow(er) beneficiaries in conjunction with the retired-worker beneficiaries. The model projects the number of uninsured aged-widow(er) beneficiaries by applying award rates to the aged uninsured male or female population and by applying termination rates to the population already receiving such benefits. The long-range model projects uninsured agedwidow(er) beneficiaries by marital status. The model multiplies the number of widow(er)s in the population aged 60 and over by the probabilities that: (1) the deceased earner is fully insured at death, (2) the widow(er) is not receiving a benefit for the care of an entitled child, (3) the widow(er) is not
fully insured, and (4) the widow(er) benefits are not withheld because of receipt of a significant government pension based on earnings in noncovered employment. In addition, the model applies the same factors to the number of divorced persons aged 60 and over in the population and includes additional factors representing the probability that the person's former earner spouse has died and that the marriage lasted at least 10 years. The model projects the number of insured aged-widow(er) beneficiaries who are ages 60 through 71 in a manner similar to that for uninsured aged-widow(er) beneficiaries. In addition, the model assumes that some insured widow(er)s who had not applied for their retired-worker benefits will receive widow(er) benefits. The model projects insured aged-widow(er) beneficiaries over age 71 by applying termination rates to the population that started receiving such benefits prior to age 71 .

The short-range model develops the number of disabled-widow(er) beneficiaries by applying award rates to the male or female population and by applying termination rates to the population already receiving a disabledwidow(er) benefit. The long-range model projects the number for each cohort by age from 50 to normal retirement age as percentages of the widowed and divorced populations, adjusted for the insured status of the deceased spouse, the prevalence of disability, and the probability that the disabled spouse is not receiving another type of benefit.

The Office of the Chief Actuary bases the projected number of children under age 18 , and students aged 18 and 19 , who are entitled to benefits as survivors of deceased workers, on the number of children in the population whose mothers or fathers are deceased. The short-range model develops the number of entitled children by applying award rates to the number of orphaned children and by applying termination rates to the number of children already receiving benefits.

The long-range model projects the number of surviving-child beneficiaries in a manner similar to that for student beneficiaries of retired workers, except that the model replaces the probability that the parent is aged 62 or over with the probability that the parent is deceased.

The Office of the Chief Actuary projects the number of surviving-disabledchild beneficiaries, aged 18 and over, from the adult population. The shortrange model applies award rates to the population and applies termination rates to the number of surviving-disabled-child beneficiaries already receiving benefits. The long-range model projects the number of surviving-dis-abled-child beneficiaries in a manner similar to that for surviving-student-

## Assumptions and Methods

child beneficiaries, except for including an additional factor to reflect the probability of being disabled before age 22 .

The short-range model develops the numbers of entitled surviving-mother and surviving-father beneficiaries by applying award rates to the number of awards to surviving-child beneficiaries, in cases where the children are either under age 16 or disabled, and by applying termination rates to the number of surviving-mother and surviving-father beneficiaries already receiving benefits. The long-range model estimates the numbers of surviving-mother and surviving-father beneficiaries, assuming they are not remarried, from the number of surviving-child beneficiaries.

The Office of the Chief Actuary projects the number of surviving-parent beneficiaries based on the historical pattern of the number of such beneficiaries.

Table V.C4 shows the projected number of beneficiaries under the OASI program by type of benefit. The retired-worker beneficiary counts include those persons who receive a residual auxiliary benefit in addition to their retiredworker benefit. The office makes estimates of the number and amount of residual payments separately for spouses and widow(er)s.

Table V.C4.-OASI Beneficiaries With Benefits in Current-Payment Status at the End of Calendar Years 1945-2100
[In thousands]

Table V.C4.-OASI Beneficiaries With Benefits in Current-Payment Status at the End of Calendar Years 1945-2100 (Cont.)
[In thousands]

| Calendar year | Retired workers and auxiliaries |  |  | Survivors |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Worker ${ }^{\text {a }}$ | Spouse | Child | Widowwidower | Motherfather | Child | Parent |  |
| High-cost (Cont.): |  |  |  |  |  |  |  |  |
| 2090 | 97,907 | 1,654 | 970 | 2,104 | 40 | 1,036 | 1 | 103,711 |
| 2095 | 97,482 | 1,649 | 950 | 2,018 | 37 | 985 | 1 | 103,121 |
| 2100 | 97,234 | 1,657 | 939 | 1,958 | 34 | 938 | 1 | 102,761 |

${ }^{\text {a }}$ Retired-worker beneficiaries include persons who also receive a residual benefit consisting of the excess of an auxiliary benefit over their retired-worker benefit.
Notes:

1. The number of beneficiaries does not include uninsured individuals who receive benefits under section 228 of the Social Security Act. Transfers from the General Fund of the Treasury reimburse the OASI Trust Fund for the cost of most of these individuals.
2. Components may not sum to totals because of rounding.

## 5. Disability Insurance Beneficiaries

The DI Trust Fund pays for benefits to workers who: (1) satisfy the disability insured requirements, (2) have applied for disabled-worker benefits, (3) are determined to be unable to engage in any substantial gainful activity due to a medically determinable physical or mental impairment severe enough to satisfy the requirements of the program, and (4) have not yet attained normal retirement age. Spouses and children of such disabled-worker beneficiaries may also receive DI benefits provided they satisfy certain criteria, primarily age and earnings requirements.

The Office of the Chief Actuary projects the number of disabled-worker beneficiaries in current-payment status (disability prevalence) for each future year. The projections start with the number in current-payment status as of December 2023. Projections of the number of applicants and new beneficiaries awarded benefits each year (disability incidence) and the number of beneficiaries leaving the disability rolls each year then determine the number in current-payment status in later years. Beneficiaries leave the rolls due to death and recovery (disability terminations) and due to conversion from dis-abled-worker to retired-worker beneficiary status at normal retirement age, after which the OASI Trust Fund pays for benefits. The remainder of this section describes the concepts of disability incidence, termination, and prevalence.

## a. Disability Incidence

The disability incidence rate is the ratio of the number of applicants newly awarded disabled-worker benefits during each year to the number of individuals who meet insured requirements but are not yet receiving benefits (the
disability-exposed population ${ }^{1}$ ). The Office of the Chief Actuary projects the number of newly awarded beneficiaries for each future year by multiplying assumed age-sex-specific disability incidence rates and the projected disabil-ity-exposed population by age and sex.

Figure V.C3 illustrates the projected incidence rates under the three alternatives along with historical rates. Incidence rates have varied substantially during the historical period since 1970 due to a variety of demographic and economic factors, along with changes in legislation and program administration. The solid lines in figure V.C3 show the age-sex-adjusted incidence rate consistent with the age-sex distribution of the disability-exposed population for 2000 . This adjustment allows a meaningful comparison of incidence rates over time by focusing on the likelihood of being awarded disabled-worker benefits, excluding the effects of a changing distribution of the population toward ages where disability is more or less likely.

The dashed lines in figure V.C3 represent the gross (unadjusted) incidence rates. The changing age-sex distribution of the exposed population over time influences these unadjusted rates. The gross incidence rate declined relative to the age-sex-adjusted rate between 1970 and 1990 as the baby-boom generation increased the size of the younger working-age population, where disability incidence is lower than in older populations. Between 1990 and 2010, the gross rate increased relative to the age-sex-adjusted rate as the babyboom generation moved into an age range where disability incidence is higher. The projected gross incidence rate generally declines relative to the age-sex-adjusted rate as the baby-boom generation moves above the normal retirement age and the lower-birth-rate cohorts of the 1970s enter prime disability ages ( 50 to normal retirement age). As these smaller cohorts age beyond normal retirement age, by about 2050, the gross incidence rate returns to a higher relative level under the intermediate assumptions. Thereafter, the gross rate remains higher than the age-sex-adjusted rate, and reflects the persistently higher average age of the working-age population compared to the population in 2000, which is largely due to lower birth rates since 1965 , and to the increase in the normal retirement age.

For the first 10 years of the projection period (through 2033), incidence rates reflect several factors following on the experience since the recession of 2007-09. At the beginning of the period of high unemployment that began in 2007, disability incidence rates started to rise to a level well above the general trend level, with rates reaching a peak in 2010. Between 2010 and 2012,

[^34]
## Assumptions and Methods

incidence rates subsided as the economy recovered, but the decline continued after 2012, reaching levels well below those expected over the long-term. A portion of the elevation of disability incidence rates experienced during the recession of 2007-09 likely contributed to the lowering of incidence rates experienced during and subsequent to the economic recovery that followed, as many individuals applied for disability benefits earlier than they would have otherwise.

For 2023, the actual age-sex-adjusted incidence rate ( 2.9 per thousand) was below the level projected in last year's report ( 3.0 per thousand). In this year's report, as in last year's report, incidence rates under the intermediate alternative are projected to rise slowly early in the projection period, consistent with the low incidence levels experienced recently. Incidence rates are projected to rise to a temporary peak level for 2027 as some of the reduced levels of new benefit awards in recent years are realized in the next few years. After 2027, incidence rates decline from the peak, reaching the ultimate assumed level of incidence at the end of the short-range period.

In 2033, at the end of the short-range period, age-sex-specific incidence rates are assumed to reach the ultimate rates assumed for the long-range projections. These ultimate age-sex-specific disability incidence rates were selected based on careful analysis of historical levels and patterns and expected future conditions, including the impact of scheduled increases in the normal retirement age. ${ }^{1}$ The ultimate incidence rates represent the expected average rates of incidence for the future.

For the intermediate alternative, the Trustees assume that the ultimate age-sex-adjusted incidence rate (adjusted to the disability-exposed population for the year 2000) will be 4.5 awards per thousand exposed, which is 0.3 per thousand lower than the ultimate rate assumed in last year's report. Figure V.C3 illustrates that the age-sex-adjusted incidence rate averaged 5.0 per thousand over the historical period 1970 through 2023, but has dropped substantially below that level since 2013. The rates seen in recent years are not consistent with an assumption of a full rise back to longer-term past historical averages. The Trustees continue to monitor experience and review the disability incidence rate assumption.

The Trustees assume that the ultimate age-sex-adjusted incidence rates for the low-cost and high-cost alternatives will be 3.6 and 5.4 awards per thousand exposed, or about 20 percent lower and higher, respectively, than the

[^35]ultimate incidence rate for the intermediate alternative. These ultimate lowcost and high-cost incidence rates are lower than those in last year's report by roughly 0.2 and 0.4 awards per thousand exposed, respectively.

Figure V.C3.-DI Disability Incidence Rates, 1970-2100
[Awards per thousand disability-exposed]

## b. Disability Termination

Beneficiaries stop receiving disability benefits when they die, experience an improvement in their medically-determinable impairment such that they are deemed able to engage in substantial gainful activity, or return to substantial work. Disabled-worker beneficiaries who return to substantial work for an extended period are deemed to have recovered, and their benefits are then terminated. The termination rate is the ratio of the number of terminations for these reasons to the average number of disabled-worker beneficiaries during the year.

The Office of the Chief Actuary projects termination rates by age, sex, and reason for termination. In addition, the office projects termination rates by duration of entitlement to disabled-worker benefits in the long-range period (post-2033).

## Assumptions and Methods

In the short-range period (through 2033), the projected age-sex-adjusted death rate (adjusted to the 2000 disabled-worker beneficiary population) under the intermediate assumptions declines from the temporarily elevated rate of 26.8 deaths per thousand beneficiaries for 2023 to about 23.6 per thousand for 2033. These rates are assumed to remain elevated through 2024 due to the COVID-19 pandemic, and then return to follow the underlying declining trend in general population mortality. The projected age-sexadjusted recovery rate (medical improvement and return to substantial work) under the intermediate assumptions decreases from the relatively high level of 21.0 per thousand beneficiaries for 2023 to 10.8 per thousand beneficiaries for 2033. The recovery rate has been high in recent years due to an ongoing administrative effort to eliminate a backlog of medical continuing disability reviews. The recovery rate is expected to decrease as the backlog of disabled-worker reviews is assumed to be eliminated by the end of 2026. Thereafter, the rate decreases toward the expected long-term projected rate. Under the low-cost and high-cost assumptions, total age-sex-adjusted termination rates due to death and recovery are roughly 10 to 20 percent higher or lower, respectively, than under the intermediate assumptions.

For the long-range period (post-2033), the Office of the Chief Actuary projects death and recovery rates by age, sex, and duration of entitlement relative to the average level of rates experienced over the base period 2011 through 2015. The assumed ultimate age-sex-adjusted recovery rate for disabledworker beneficiaries is 10.8 per thousand beneficiaries under the intermediate alternative, which is 0.4 per thousand higher than the ultimate rate assumed in last year's report. The assumed ultimate age-sex-adjusted recovery rates for the low-cost and high-cost alternatives are 13.0 and 8.6 recoveries per thousand beneficiaries, respectively. These ultimate low-cost and high-cost recovery rates are higher than those in last year's report by roughly 0.5 and 0.3 per thousand, respectively. Death rates by age and sex change throughout the long-range period at the same rate as death rates in the general population. The age-sex-adjusted death rate decreases from 26.8 per thousand beneficiaries in 2023 to $21.5,12.4$, and 6.2 per thousand disabledworker beneficiaries for 2098 under the low-cost, intermediate, and high-cost assumptions, respectively.

Figure V.C4 illustrates gross and age-sex-adjusted total termination rates (including both recoveries and deaths) for disabled-worker beneficiaries for the historical period since 1970, and for the projection period through 2100. As with incidence rates, the age-sex-adjusted termination rate illustrates the real change in the tendency to terminate benefits. Changes in the age-sex distribution of the beneficiary population influence the gross termination rate. A
shift in the disabled-worker beneficiary population to older ages, as occurred over the past 20 years when the baby-boom generation moved into pre-retirement ages, increases gross death termination rates relative to the age-sexadjusted rates.

Figure V.C4.-DI Disability Termination Rates, 1970-2100
[Terminations per thousand disabled-worker beneficiaries]

## c. DI Beneficiaries and Disability Prevalence Rates

Incidence and termination rates are the foundation for projecting the number of disabled-worker beneficiaries in current-payment status. At normal retirement age, all disabled-worker beneficiaries convert to retired-worker status and leave the DI rolls.

The Office of the Chief Actuary makes detailed projections of disabledworker awards, terminations, and conversions and combines these to project the number of disabled workers receiving benefits over the next 75 years. Table V.C5 presents the projected numbers of disabled-worker beneficiaries in current-payment status. The number of disabled-worker beneficiaries in current-payment status grows from 7.4 million at the end of 2023, to 9.7 million, 11.2 million, and 11.2 million at the end of 2100 , under the lowcost, intermediate, and high-cost assumptions, respectively. Of course, much of this growth results from the growth and changing age distribution of the

## Assumptions and Methods

population described earlier in this chapter. Table V.C5 also presents projected numbers of auxiliary beneficiaries and disability prevalence rates on both a gross basis and an age-sex-adjusted basis.

${ }^{\text {a }}$ Adjusted to the age-sex distribution of the disability insured population for the year 2000.
Note: Components may not sum to totals because of rounding.
The disability prevalence rate is the ratio of the number of disabled-worker beneficiaries in current-payment status to the number of persons insured for disability benefits. Figure V.C5 illustrates the historical and projected disability prevalence rates on both a gross basis and on an age-sex-adjusted basis (adjusted to the age-sex distribution of the disability insured population for the year 2000).
Changes in prevalence rates are a direct result of changes in incidence rates and termination rates. Annual incidence and termination rates are not directly comparable or combinable because their denominators differ.

Figure V.C5.-DI Disability Prevalence Rates, 1970-2100
[Rate per thousand persons insured for disability benefits]

Age-sex-adjusted prevalence rates have increased primarily because: (1) termination rates, in particular death termination rates, have declined; (2) incidence rates at younger ages have increased relative to rates at older ages (new beneficiaries at younger ages have more potential years on the disability rolls); (3) incidence rates have increased substantially for women to parity with men; and (4) the maturation of the DI program (disabled-worker benefits became available to those over age 50 at the start of the program in 1957 and to younger workers in 1960, and disability insured status requirements were eased for those under age 31 in 1968). Gross prevalence rates have increased more than age-sex-adjusted prevalence rates since the babyboom generation began to reach ages 45 through normal retirement age, a time of life when disability incidence rates are relatively high. The Office of the Chief Actuary projects both gross and age-sex adjusted prevalence rates to grow at a slower pace based on assumed stabilization in these four factors: (1) the age distribution of the general population, (2) the age distribution of the disability insured population, (3) incidence rates by age and sex, and (4) DI program age and insured requirements. As these factors gradually stabilize, the declining death termination rate continues to have a small influence toward higher disability prevalence rates.

As mentioned above in the discussion of incidence and termination rates, the age-sex-adjusted prevalence rate isolates the changing trend in the underlying likelihood of receiving benefits for the insured population, without reflecting changes in the age and sex distribution of the population. As with incidence rates, gross disability prevalence rates declined relative to the age-sex-adjusted rate when the baby-boom generation reached working age between 1970 and 1990; this trend reflects the lower disability prevalence rates associated with younger ages. Conversely, the gross rate of disability prevalence has increased relative to the age-sex-adjusted rate after 1990 due to the aging of the baby-boom generation into ages with higher disability prevalence rates.

Under the intermediate assumptions, the projected age-sex-adjusted disability prevalence rate grows from 32.7 per thousand disability insured workers at the end of 2023 to 40.3 per thousand at the end of 2100 . The projected age-sex-adjusted disability prevalence rate at the end of 2100 is 30.3 per thousand under the low-cost assumptions and 50.7 per thousand under the high-cost assumptions.

Table V.C5 presents projections of the numbers of auxiliary beneficiaries paid from the DI Trust Fund. As indicated at the beginning of this subsection, auxiliary beneficiaries are qualifying spouses and children of disabledworker beneficiaries. A spouse must either be at least age 62 or have an eligible child beneficiary in his or her care who is either under age 16 or disabled prior to age 22 . A child must be: (1) under age 18 , (2) age 18 or 19 and still a student in high school, or (3) age 18 or older and disabled prior to age 22.

The projection of the number of auxiliary beneficiaries relies on the projected number of disabled-worker beneficiaries. In the short-range period (2024 through 2033), the Office of the Chief Actuary projects incidence and termination rates for each category of auxiliary beneficiary. After 2033, the office projects child beneficiaries at ages 18 and under in relation to the projected number of children in the population using the probability that either of their parents is a disabled-worker beneficiary. The office projects the remaining categories of children and spouses in a similar manner.

## 6. Covered and Taxable Earnings, Taxable Payroll, and Payroll Tax Contributions

Covered earnings include both covered wages and covered self-employment net earnings. The Office of the Chief Actuary projects covered wages for component sectors of the economy (i.e., private, State and local government, Federal civilian, and military) based on the projected overall growth of sec-

## Assumptions and Methods

toral and total wages in the U.S. economy. The projections of covered wages also reflect changes in covered employment due to a relative increase in noncovered undocumented immigrants and to the mandatory coverage of new hires in the Federal civilian sector. The office projects covered self-employment net earnings based on the growth in net proprietors' income in the U.S. economy.

Taxable earnings are the portion of covered earnings subject to the Social Security payroll tax. Taxable wages for an employee are total covered wages from all wage employment up to the contribution and benefit base. Taxable wages for an employer are the sum of all covered wages paid to each employee up to the base. Employees with multiple jobs whose total wages exceed the base are eligible for a refund of excess employee taxes withheld; employers are not eligible for a refund on this basis. For self-employed workers with no taxable wages, taxable earnings are the amount of covered self-employment net earnings up to the base. For self-employed workers with taxable wages less than the base, covered self-employment net earnings are taxable up to the difference between the base and their taxable wages. For projection purposes, the Office of the Chief Actuary computes taxable earnings based on a proportion of covered earnings that is at or below the base.

The OASDI taxable payroll (see table VI.G6) for a year is computed as the amount of earnings which, when multiplied by the combined OASDI employee-employer payroll tax rate for that year, yields the total amount of payroll taxes due from wages paid and self-employment net earnings for the year. Taxable payroll is used as the denominator for income rates, cost rates, and actuarial balances. Taxable payroll is derived by adjusting total taxable earnings to account for categories of earnings that are taxed at rates other than the combined employee-employer rate and to take into account amounts credited as wages that were not included in normally reported wages. For 1951 and later, taxable earnings are reduced by one-half of the amount of wages paid to employees with multiple jobs that exceed the contribution and benefit base. For 1983 through 2001, deemed wage credits for military service after 1956 are added to taxable earnings. The self-employment tax rates for 1951 through 1983 were less than the combined employee-employer rates; therefore, the self-employment component of taxable payroll for those years is reduced by multiplying the ratio of the self-employment rate to the combined employee-employer rate times the taxable self-employment net earnings. Finally, for 1966 through 1979, employers were exempt from paying their share of payroll tax on their employees' tips and, for 1980 through 1987, employers paid tax on only part of their employees' tips. For those
years, the taxable payroll is reduced by half of the amount of tips for which the employer owed no payroll tax.

The ratio of taxable payroll to covered earnings (the taxable ratio) declined from 88.6 percent for 1984 to 82.6 percent for 2000 , mostly due to much larger increases in wage levels for very high earners than for all other earners. From 2000 to 2010, the taxable ratio varied with the business cycle, rising during economic downturns and declining during recoveries. Specifically, the taxable ratio rose to 85.7 percent for 2002 , declined to 82.4 percent for 2007 , rose to 85.2 percent for 2009 , and averaged 83.0 percent for the period 2010 to 2019.

The ratio declined to 82.2 percent for 2020 from the previous year's 83.1 percent. Unlike previous economic downturns, the pandemic-induced recession led to a much greater decrease in wages for earners at the low end of the earnings distribution than for those at the high end. This resulted in a relatively higher proportion of total wages being above the contribution and benefit base than has typically been the case in other economic downturns. The ratio declined further to 80.4 percent for 2021 , mainly due to increases in bonuses paid to high earners and the exercising of stock options. The taxable ratio is estimated to increase to 82.1 percent for 2022.

For each alternative, the ratios move gradually from 2022 to the assumed level at the end of the short-range period (2033): 84.0 percent for the lowcost assumptions, 82.5 percent for the intermediate assumptions, and 81.0 percent for the high-cost assumptions. ${ }^{1}$ These are the same assumptions that the Trustees used for the end of the short-range period (2032) for the 2023 report.

The Office of the Chief Actuary projects payroll tax contributions using the patterns of tax collection required by Federal laws and regulations. The office determines payroll tax liabilities by multiplying the scheduled tax rates for each year by the amount of taxable wages and self-employment net earnings for that year. The office then splits these liabilities into amounts by collection period. For wages, Federal law requires that employers withhold OASDI and HI payroll taxes and Federal individual income taxes from employees' pay. As an employer's accumulation of such taxes (including the employer share of payroll taxes) meets certain thresholds, which the Department of the Treasury determines, the employer must deposit these taxes with the U.S. Treasury by a specific day, depending on the amount of money

[^36]involved. ${ }^{1}$ For projection purposes, the office splits the payroll tax contributions related to wages into amounts paid in the same quarter as incurred and in the following quarter. Self-employed workers must make estimated tax payments on their earnings four times during the year and make up any underestimate on their individual income tax returns. The projection splits the self-employed tax liabilities by collection quarter to reflect this pattern.

The projected tax contributions also reflect the method used to ensure that money transferred to the trust funds is adjusted, over time, to equal the actual liability owed. Because payers generally make tax payments without identifying the separate OASDI contribution amounts, Treasury makes daily transfers of money from the General Fund to the trust funds on an initial estimated basis. The Social Security Administration periodically certifies the amounts of wages and self-employment net earnings on which tax contributions are owed for each year, at which time Treasury determines adjustments to appropriations to reconcile tax liabilities with deposits in the trust funds. This process also includes periodic transfers from the trust funds to the General Fund for contributions on wages in excess of the contribution and benefit base.

Table V.C6 shows the payroll tax contribution rates applicable under current law in each calendar year and the allocation of these rates between the OASI and DI Trust Funds. ${ }^{2}$ It also shows the contribution and benefit base for each year through 2024.

[^37]Table V.C6.-Contribution and Benefit Base and Payroll Tax Contribution Rates

${ }^{\text {a }}$ Except as noted below, the combined employee/employer rate is divided equally between employees and employers.
${ }^{\mathrm{b}}$ Beginning in 1990, self-employed persons receive a deduction, for purposes of computing their net earnings, equal to half of the combined OASDI and HI contributions that would be payable without regard to the contribution and benefit base. The OASDI contribution rate then applies to net earnings after this deduction, but subject to the OASDI base.
${ }^{c}$ In 1984 only, employees received an immediate credit of 0.3 percent of taxable wages against their OASD payroll tax contributions. The self-employed received similar credits of 2.7 percent, 2.3 percent, and 2.0 percent against their combined OASDI and Hospital Insurance (HI) contributions on net earnings from self-employment in 1984, 1985, and 1986-89, respectively. The General Fund of the Treasury reimbursed the trust funds for these credits.
${ }^{\mathrm{d}}$ Public Law 111-147 exempted most employers from paying the employer share of OASDI payroll tax on wages paid during the period March 19, 2010 through December 31, 2010 to certain qualified individuals hired after February 3, 2010. Public Law 111-312 reduced the OASDI payroll tax rate for 2011 by 2 percentage points for employees and for self-employed workers. Public Law 112-96 extended the 2011 rate reduction through 2012. These laws require that the General Fund of the Treasury reimburse the OASI and DI Trust Funds for these temporary reductions in 2010 through 2012 payroll tax revenue, in order to "replicate to the extent possible" revenue that would have been received if the combined employee/employer payroll tax rates had remained at 12.4 percent for OASDI ( 10.6 percent for OASI and 1.8 percent for DI).
${ }^{\mathrm{e}}$ Subject to automatic adjustment based on increases in average wages.

## 7. Income From Taxation of Benefits

Under current law, the OASI and DI Trust Funds are credited with income tax revenue from the taxation of up to the first 50 percent of taxpayers' OASI and DI benefit payments. (The HI Trust Fund receives the remainder of the income tax revenue from the taxation of up to 85 percent of taxpayers' OASI and DI benefit payments.) Benefits are partially subject to federal income tax for beneficiaries with income (defined for this purpose as adjusted gross income excluding Social Security benefits, plus half of their Social Security benefits and all of their non-taxable interest income) in excess of specified
threshold amounts. The threshold amounts are $\$ 25,000$ for single filers, $\$ 32,000$ for joint filers, and $\$ 0$ for those married individuals filing separately.
For the short-range period, the Office of the Chief Actuary estimates the income to the OASI and DI Trust Funds from taxation of benefits by applying the following two factors (projected by the Office of Tax Analysis, Department of the Treasury) to total OASI and DI scheduled benefits: (1) the percentage of taxpayers' scheduled benefits (limited to 50 percent) that is taxable and (2) the average marginal tax rate applicable to those benefits. Up to 85 percent of benefits may be subject to federal income tax, with any tax on more than 50 percent of a taxpayer's benefits credited to the Medicare Hospital Insurance Trust Fund.

For the long-range period, the office estimates the income to the trust funds from taxation of benefits by applying projected ratios of taxation of OASI and DI benefits to total OASI and DI scheduled benefits. These tax ratios rely on estimates from the Office of Tax Analysis in the Department of the Treasury. The Office of the Chief Actuary's estimates reflect the following assumptions: (1) The income thresholds used for benefit taxation are specified in the Internal Revenue Code to be constant in the future, and have never been changed, while income and benefit levels continue to rise. Accordingly, projected ratios of income from taxation of benefits to the amount of benefits increase gradually. (2) A permanent level shift upward in the ratios is projected for 2026 and beyond due to the expiration of the personal income tax provisions in Public Law 115-97, the Tax Cuts and Jobs Act of 2017. (3) Because indexation of income tax brackets is not specified in the Social Security Act, and because periodic changes have been made in the past to avoid indefinite compression of the income tax brackets relative to income levels (bracket creep), the Trustees assume that such periodic changes will occur in the future. As a result, after the tenth year of the projection period, income tax brackets are assumed to rise with average wages, rather than with the C-CPI-U as specified under current law. Thus, the income tax brackets are projected to roughly maintain their levels relative to the income distribution.

## 8. Average Benefits

Projections of average benefits for each benefit type reflect recent historical averages, projected average primary insurance amounts (PIAs), and projected ratios of average benefits to average PIAs. Calculations of average PIAs are based on projected distributions of beneficiaries by duration from year of initial entitlement, average PIAs at initial entitlement, and increases in PIAs after initial entitlement. Projected increases in average PIAs after ini-
tial entitlement depend on automatic benefit increases, recomputations to reflect additional covered earnings, and differences in mortality by level of lifetime earnings. Calculations of future average PIAs at initial entitlement are based on projected earnings histories, which in turn reflect a combination of the actual earnings histories associated with a sample of 2019 initial entitlements and more recent actual earnings levels by age and sex for covered workers.

For retired-worker, aged-spouse, and aged-widow(er) benefits, the percentage of the PIA that is payable depends on the age at initial entitlement to benefits. Projected ratios of average benefits to average PIAs for these types of benefits are based on projections of age distributions at initial entitlement.

## 9. Scheduled Benefits

For each type of benefit, scheduled benefits are the product of the number of beneficiaries and the corresponding average monthly benefit. The shortrange model calculates scheduled benefits on a quarterly basis. The longrange model calculates all scheduled benefits on an annual basis, using the number of beneficiaries at the beginning and end of the year. Adjustments to these annual scheduled benefits include retroactive payments to newly awarded beneficiaries and other amounts not reflected in the regular monthly scheduled benefits.

Scheduled lump-sum death benefits are estimated as the product of: (1) the number of lump-sum death payments projected on the basis of the assumed death rates, the projected fully insured population, and the estimated percentage of the fully insured population that will qualify for lump-sum death payments; and (2) the amount of the lump-sum death payment, which is $\$ 255$ (unindexed since 1973).

## 10. Illustrative Scheduled Benefit Amounts

Table V.C7 shows, under the intermediate assumptions, future scheduled benefit amounts payable upon retirement at the normal retirement age and at age 65, for various hypothetical workers attaining age 65 in 2024 and subsequent years. The illustrative benefit amounts in table V.C7 are presented in CPI-indexed 2024 dollars-that is, adjusted to 2024 levels by the CPI indexing series shown in table VI.G6. Table V.C7 also shows each benefit amount as a percentage of the average of each hypothetical worker's highest 35 years of Social Security covered earnings, indexed by national average wage growth to the year prior to initial entitlement to retired worker benefits. ${ }^{1}$

[^38]The normal retirement age was 65 for individuals who reached age 62 before 2000. It increased to age 66 during the period 2000 through 2005, at a rate of 2 months per year as workers attained age 62 . Under current law, the normal retirement age increases to age 67 during the period 2017 through 2022, also by 2 months per year as workers attain age 62 . The illustrative benefit amounts shown in table V.C7 for retirees at age 65 are lower than the amounts shown for retirees at normal retirement age because monthly benefits taken before normal retirement age are reduced to reflect the expected additional years benefits will be collected. For example, those who start collecting benefits at age 65 in 2027 and survive to age 67 will receive benefits for two more years than if they had instead waited to start collecting benefits at normal retirement age in 2029.

Table V.C7 shows five different pre-retirement earnings patterns. Four of these patterns assume the earnings history of workers with scaled-earnings patterns ${ }^{1}$ and reflect very low, low, medium, and high career-average levels of pre-retirement earnings starting at age 21. The fifth pattern assumes the earnings history of a steady maximum earner starting at age 22. The four scaled-earnings patterns derive from earnings experienced by insured workers during calendar years 2001 through 2020. These earnings levels differ by age. The career-average level of earnings for each scaled case targets a percent of the AWI.

For the scaled medium earner, the career-average earnings level is about equal to the AWI (estimated to be $\$ 68,793$ for 2024). For the scaled very low, low, and high earners, the career-average earnings level, wage-indexed to the year before starting benefits, is about 25 percent, 45 percent, and 160 percent of the AWI, respectively (estimated to be $\$ 17,198, \$ 30,957$, and $\$ 110,069$, respectively, for 2024). The steady maximum earner has earnings at or above the contribution and benefit base ( $\$ 168,600$ for 2024) for each year starting at age 22 through the year prior to retirement.

[^39]Table V.C7.-Annual Scheduled Benefit Amounts ${ }^{\mathbf{a}}$ for Retired Workers With Various Pre-Retirement Earnings Patterns Based on Intermediate Assumptions, Calendar Years 2024-2100

| Year attain age 65 ${ }^{\text {b }}$ | Retirement at normal retirement age |  |  | Retirement at age 65 |  |  |

## 11. Administrative Expenses

The projection of administrative expenses through the short-range period is based on historical experience and the projected growth in average wages. The Office of Budget of the Social Security Administration provides estimates for the first several years of the projection. For years after the shortrange period, projected administrative expenses reflect increases in the number of beneficiaries in current-payment status, and increases in the average wage. However, the increases in average wage are partially offset by assumed administrative productivity gains.

## 12. Railroad Retirement Financial Interchange

Railroad workers are covered under a separate multi-tiered benefit plan, with a first tier of coverage similar to OASDI coverage. An annual financial interchange between the Railroad Retirement fund and the OASI and DI Trust Funds is made to resolve the difference between: (1) the amount of OASDI benefits that would be paid to railroad workers and their families if railroad employment had been covered under the OASDI program, plus administrative expenses associated with these benefits; and (2) the amount of OASDI payroll tax and income tax that would be received with allowances for interest from railroad workers.

The Office of the Chief Actuary's projection of future amounts for the financial interchange with the Railroad Retirement fund reflects trends similar to those used in estimating the cost of OASDI benefits. The annual short-range net cost for the OASI and DI Trust Funds is about $\$ 6$ to $\$ 7$ billion and the long-range summarized net cost for the OASI and DI Trust Funds is 0.05 percent of taxable payroll.

## VI. APPENDICES

## A. HISTORY OF OASI AND DI TRUST FUND OPERATIONS

The Federal Old-Age and Survivors Insurance (OASI) Trust Fund was established on January 1, 1940 as a separate account in the United States Treasury. The Federal Disability Insurance (DI) Trust Fund, another separate account in the United States Treasury, was established on August 1, 1956. These funds conduct the financial operations of the OASI and DI programs. The Board of Trustees is responsible for overseeing the financial operations of these funds. The following paragraphs describe the various components of trust fund income and cost. Following this description, tables VI.A1 and VI.A2 present the historical operations of the separate trust funds since their inception, and table VI.A3 presents the operations of the hypothetical combined trust funds ${ }^{1}$ during the period when they have co-existed.

The primary income of these two funds comes from appropriations under permanent authority on the basis of payroll tax contributions. Federal law requires that all employees who work in OASDI covered employment, and their employers, make payroll tax contributions on their wages up to a specified annual maximum amount (the contribution and benefit base). Employees and their employers must also make payroll tax contributions on monthly cash tips if such tips are at least $\$ 20$. Self-employed persons must make payroll tax contributions on their covered net earnings from self-employment subject to the annual contribution and benefit base. The Federal Government pays amounts equivalent to the combined employer and employee contributions that would be paid on deemed wage credits attributable to military service performed between 1957 and 2001, if such wage credits were covered wages. Treasury initially deposits payroll tax contributions to the trust funds each day on an estimated basis. Subsequently, Treasury makes adjustments based on the certified amount of wages and self-employment earnings in the records of the Social Security Administration.

Income also includes various reimbursements from the General Fund of the Treasury, such as: (1) the cost of noncontributory wage credits for military service before 1957, and periodic adjustments to previous determinations of this cost; (2) the cost in 1971 through 1982 of deemed wage credits for military service performed after 1956; (3) the cost of benefits to certain uninsured persons who attained age 72 before 1968; (4) the cost of payroll tax credits provided to employees in 1984 and self-employed persons in 1984 through 1989 by Public Law 98-21; (5) the cost in 2009 through 2017 of excluding certain self-employment earnings from SECA taxes under Public

[^41]
## Appendices

Law 110-246; and (6) payroll tax revenue forgone under the provisions of Public Laws 111-147, 111-312, 112-78, and 112-96. This also includes a portion of proceeds of repayments of loans authorized by Public Law 116-136.

Beginning in 1984, Federal law subjected up to 50 percent of an individual's or couple's OASDI benefits to Federal income taxation under certain circumstances. Effective for taxable years beginning after 1993, the law increased the maximum percentage from 50 percent to 85 percent. Treasury credits the proceeds from this taxation of up to 50 percent of benefits to the OASI and DI Trust Funds in advance, on an estimated basis, at the beginning of each calendar quarter, with no reimbursement to the General Fund for interest costs attributable to the advance transfers. ${ }^{1}$ Treasury makes subsequent adjustments based on the actual amounts shown on annual income tax records. Each of the OASI and DI Trust Funds receives the income taxes paid on the benefits from that trust fund. ${ }^{2}$

Another source of income to the trust funds is interest received on investments held by the trust funds. On a daily basis, Treasury invests trust fund income in interest-bearing obligations of the U.S. Government. These investments include the special public-debt obligations described in the next paragraph. The Social Security Act also authorizes the trust funds to hold obligations guaranteed as to both principal and interest by the United States. The act therefore permits the trust funds to hold certain Federally sponsored agency obligations and marketable obligations. ${ }^{3}$ The trust funds may acquire any of these obligations on original issue at the issue price or by purchase of outstanding obligations at their market price.

The Social Security Act authorizes the issuance of special public-debt obligations for purchase exclusively by the trust funds. The act provides that the interest rate for special obligations newly issued in any month is the average market yield, as of the last business day of the prior month, on all of the outstanding marketable U.S. obligations that are due or callable more than 4 years in the future. This rate is rounded to the nearest one-eighth of one percent. Beginning January 1999, in calculating the average market yield rate for this purpose, the Treasury incorporates the yield to the call date when a callable bond's market price is above par.

Although the Social Security Act does not authorize the purchase or sale of special issue securities in the open market, Treasury redeems special issue

[^42]securities prior to maturity at par value when needed to meet current operating expenses. As a result, changes in market yield rates after issuance of special issue securities do not cause fluctuations in the value of these securities. As is true for marketable Treasury securities held by the public, the full faith and credit of the U.S. Government backs all of the investments held by the trust funds.

Annual cost for the OASI and DI Trust Funds primarily consists of: (1) OASDI benefit payments ${ }^{1}$, net of any reimbursements from the General Fund of the Treasury for unnegotiated benefit checks; and (2) expenses incurred by the Social Security Administration and the Department of the Treasury in administering the OASDI program and the provisions of the Internal Revenue Code relating to the collection of contributions. Such administrative expenses include, among other items, the cost of (1) payroll; (2) construction, rental, lease, or purchase of office buildings and related facilities for the Social Security Administration; and (3) information technology systems. The Social Security Act prohibits payments from the OASI and DI Trust Funds for any purpose not related to the payment of benefits or administrative costs for the OASDI program.

Annual cost also includes: (1) the costs of vocational rehabilitation services furnished to disabled persons receiving cash benefits because of their disabilities, where such services contributed to their successful rehabilitation; and (2) net costs of the provisions of the Railroad Retirement Act that provide for a system of coordination and financial interchange between the Railroad Retirement program and the Social Security program. Under the financial interchange provisions, the Railroad Retirement program's Social Security Equivalent Benefit Account and the trust funds interchange amounts on an annual basis so that each trust fund is in the same position it would have been had railroad employment always been covered under Social Security.

The statements of the operations of the trust funds in this report do not include the net worth of facilities and other fixed capital assets because the value of fixed capital assets is not available in the form of a financial asset redeemable for the payment of benefits or administrative costs. As a result of this unavailability, the actuarial status of the trust funds does not take these assets into account.

${ }^{\text {a }}$ Beginning in 1979, benefit payments scheduled to be paid on January 3 of a given year were paid on December 31 of the preceding year as required by the statutory provision included in the 1977 Social Security Amendments for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. Such advance payments have occurred about every 7 years, first for benefits scheduled for January 3, 1982. For comparability with other historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment in each year without regard to the accelerated payments described above.
${ }^{\mathrm{b}}$ Represents asset reserves at the beginning of a year as a percentage of cost during the year. The table shows no ratio for 1937 because no reserves existed at the beginning of the year.
${ }^{\text {c }}$ Includes adjustments for prior calendar years.
${ }^{d}$ Includes net reimbursements from the General Fund of the Treasury to the OASI Trust Fund for: (1) the cost of noncontributory wage credits for military service before 1957; (2) the cost in 1971-82 of deemed wage credits for military service performed after 1956; (3) the cost of benefits to certain uninsured persons who attained age 72 before 1968; (4) the cost of payroll tax credits provided to employees in 1984 and self-employed persons in 198489 by Public Law 98-21; (5) the cost in 2009-17 of excluding certain self-employment earnings from SECA taxes under Public Law 110-246; and (6) payroll tax revenue forgone under the provisions of Public Laws 111-147, 111312, 112-78, and 112-96. Also includes transfers of a portion of proceeds from repayments of loans authorized under Public Law 116-136.
${ }^{\text {e }}$ Net interest includes net profits or losses on marketable investments. Beginning in 1967, the trust fund pays administrative expenses on an estimated basis, with a final adjustment including interest made in the following fiscal year. Net interest includes the amounts of these interest adjustments. The 1970 report describes the accounting for administrative expenses for years prior to 1967. Beginning in October 1973, figures include relatively small amounts of gifts to the fund. Net interest for 1983-86 reflects payments for interest on amounts owed under the interfund borrowing provisions. During 1983-90, net interest reflects interest reimbursements paid from the trust fund to the General Fund on advance tax transfers.
${ }^{\mathrm{f}}$ Beginning in 1966, includes payments for vocational rehabilitation services furnished to disabled persons receiving benefits because of their disabilities. Beginning in 1983, net benefit amounts include reimbursements paid from the General Fund to the trust fund for unnegotiated benefit checks. Excluding the portion attributable to vocational rehabilitation services and unnegotiated benefit checks, amounts are the same as benefits scheduled under law at that time for all historical years.
g Operations prior to 1940 are for the Old-Age Reserve Account established by the original Social Security Act. The 1939 Amendments transferred the asset reserves of the Account to the OASI Trust Fund effective January 1, 1940.
${ }^{\mathrm{h}}$ Between - $\$ 50$ million and $\$ 50$ million.
${ }^{\text {i }}$ Reflects interfund borrowing of $\$ 17.5$ billion by the OASI Trust Fund from the DI and HI Trust Funds in 1982 and the subsequent repayment of those loans in 1985 ( $\$ 4.4$ billion) and 1986 ( $\$ 13.2$ billion).
${ }^{\mathrm{j}}$ Reserves used for the trust fund ratio calculation include January advance tax transfers.
Note: Components may not sum to totals because of rounding.

${ }^{\text {a }}$ Beginning in 1979, benefit payments scheduled to be paid on January 3 of a given year were paid on December 31 of the preceding year as required by the statutory provision included in the 1977 Social Security Amendments for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. Such advance payments have occurred about every 7 years, first for benefits scheduled for January 3, 1982. For comparability with other historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment in each year without regard to the accelerated payments described above.
${ }^{\mathrm{b}}$ Represents asset reserves at the beginning of a year as a percentage of cost during the year. The table shows no ratio for 1957 because no reserves existed at the beginning of the year
${ }^{\mathrm{c}}$ Includes adjustments for prior calendar years.
${ }^{d}$ Includes net reimbursements from the General Fund of the Treasury to the DI Trust Fund for: (1) the cost of noncontributory wage credits for military service before 1957; (2) the cost in 1971-82 of deemed wage credits for military service performed after 1956; (3) the cost of payroll tax credits provided to employees in 1984 and selfemployed persons in 1984-89 by Public Law 98-21; (4) the cost in 2009-17 of excluding certain self-employment earnings from SECA taxes under Public Law 110-246; and (5) payroll tax revenue forgone under the provisions of Public Laws 111-147, 111-312, 112-78, and 112-96.
${ }^{\mathrm{e}}$ Net interest includes net profits or losses on marketable investments. Beginning in 1967, the trust fund pays administrative expenses on an estimated basis, with a final adjustment including interest made in the following fiscal year. Net interest includes the amounts of these interest adjustments. The 1970 report describes the accounting for administrative expenses for years prior to 1967. Beginning in July 1974, figures include relatively small amounts of gifts to the fund. Net interest for 1983-86 reflects payments for interest on amounts owed under the interfund borrowing provisions. During 1983-90, net interest reflects interest reimbursements paid from the trust fund to the General Fund on advance tax transfers.
${ }^{\mathrm{f}}$ Beginning in 1966, includes payments for vocational rehabilitation services furnished to disabled persons receiving benefits because of their disabilities. Beginning in 1983, net benefit amounts include reimbursements paid from the General Fund to the trust fund for unnegotiated benefit checks. Excluding the portion attributable to vocational rehabilitation services and unnegotiated benefit checks, amounts are the same as benefits scheduled under law at that time for all historical years.
g Between - $\$ 50$ million and $\$ 50$ million.
${ }^{\mathrm{h}}$ Reflects interfund borrowing by the OASI Trust Fund from the DI Trust Fund in 1982 of $\$ 5.1$ billion and the subsequent repayment of that loan in 1985 ( $\$ 2.5$ billion) and 1986 ( $\$ 2.5$ billion).
${ }^{\mathrm{i}}$ Reserves used for the trust fund ratio calculation include January advance tax transfers.
Note: Components may not sum to totals because of rounding.

${ }^{\text {a }}$ Beginning in 1979, benefit payments scheduled to be paid on January 3 of a given year were paid on December 31 of the preceding year as required by the statutory provision included in the 1977 Social Security Amendments for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. Such advance payments have occurred about every 7 years, first for benefits scheduled for January 3, 1982. For comparability with other historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment in each year without regard to the accelerated payments described above.
${ }^{\mathrm{b}}$ Represents asset reserves at the beginning of a year as a percentage of cost during the year.
${ }^{\mathrm{c}}$ Includes adjustments for prior calendar years.
${ }^{d}$ Includes net reimbursements from the General Fund of the Treasury to the OASI and DI Trust Funds for: (1) the cost of noncontributory wage credits for military service before 1957; (2) the cost in 1971-82 of deemed wage credits for military service performed after 1956; (3) the cost of benefits to certain uninsured persons who attained age 72 before 1968; (4) the cost of payroll tax credits provided to employees in 1984 and self-employed persons in 1984-89 by Public Law 98-21; (5) the cost in 2009-17 of excluding certain self-employment earnings from SECA taxes under Public Law 110-246; and (6) payroll tax revenue forgone under the provisions of Public Laws 111147, 111-312, 112-78, and 112-96. Also includes transfers of a portion of proceeds from repayments of loans authorized under Public Law 116-136.
${ }^{\mathrm{e}}$ Net interest includes net profits or losses on marketable investments. Beginning in 1967, the trust funds pay administrative expenses on an estimated basis, with a final adjustment including interest made in the following fiscal year. Net interest includes the amounts of these interest adjustments. The 1970 report describes the accounting for administrative expenses for years prior to 1967. Beginning in October 1973, figures include relatively small amounts of gifts to the funds. Net interest for 1983-86 reflects payments for interest on amounts owed under the interfund borrowing provisions. During 1983-90, net interest reflects interest reimbursements paid from the trust funds to the General Fund on advance tax transfers.
${ }^{\mathrm{f}}$ Beginning in 1966, includes payments for vocational rehabilitation services furnished to disabled persons receiving benefits because of their disabilities. Beginning in 1983, net benefit amounts include reimbursements paid from the General Fund to the trust funds for unnegotiated benefit checks. Excluding the portion attributable to vocational rehabilitation services and unnegotiated benefit checks, amounts are the same as benefits scheduled under law at that time for all historical years.
g Between - $\$ 50$ million and $\$ 50$ million.
${ }^{h}$ Reflects interfund borrowing by the OASI Trust Fund from the HI Trust Fund in 1982 of $\$ 12.4$ billion and the subsequent repayment of that loan in 1985 ( $\$ 1.8$ billion) and 1986 ( $\$ 10.6$ billion).
${ }^{\mathrm{i}}$ Reserves used for the trust fund ratio calculation include January advance tax transfers.
Note: Components may not sum to totals because of rounding.
Tables VI.A4 and VI.A5 show the total asset reserves of the OASI Trust Fund and the DI Trust Fund, respectively, at the end of calendar years 2022 and 2023. The tables show the invested asset reserves by interest rate and year of maturity. Bonds issued to the trust funds in 2023 had an interest rate of 3.875 percent, compared with an interest rate of 3.000 percent for bonds issued in 2022.

# Table VI.A4.-OASI Trust Fund Asset Reserves, End of 

Calendar Years 2022 and 2023
[In thousands]

${ }^{a}$ A negative amount for a given year represents a situation where actual program cost exceeded the amount of invested securities of the OASI Trust Fund that were redeemed to cover such cost, and future redemption of additional invested securities will be required to pay for this shortfall. A positive balance represents a situation where the invested securities of the OASI Trust Fund that were redeemed to make cash payments exceeded actual program cash payments; in this situation, this excess amount will be used to partially offset future redemption of additional invested securities.
Note: Amounts of special issue securities are at par value. The trust fund purchases and redeems special issue securities at par value. The table groups equal amounts that mature in two or more years at a given interest rate.

${ }^{\text {a }}$ A negative amount for a given year represents a situation where actual program cost exceeded the amount of invested securities of the DI Trust Fund that were redeemed to cover such cost; in this situation, future redemption of additional invested securities will be required to pay for this shortfall. A positive balance represents a situation where the invested securities of the DI Trust Fund that were redeemed to make cash payments exceeded actual program cash payments; in this situation, this excess amount will be used to partially offset future redemption of additional invested securities.
Note: Amounts of special issue securities are at par value. The trust fund purchases and redeems special issue securities at par value. The table groups equal amounts that mature in two or more years at a given interest rate.

## B. HISTORY OF ACTUARIAL STATUS ESTIMATES

This appendix chronicles the history of the long-range OASDI actuarial balance and the year of combined OASI and DI Trust Fund reserve depletion since 1982 under the intermediate assumptions. The actuarial balance is the principal summary measure of actuarial status for the long-range period as a whole. The year of trust fund reserve depletion is also critical, as it indicates the year by which legislative action would be needed in order to maintain timely payment of scheduled benefits.

The 1983 report was the last report for which the actuarial balance was positive for the OASDI program. The two basic components of actuarial balance are the summarized income rate and the summarized cost rate, both of which are expressed as percentages of taxable payroll over the period. Section IV.B. 4 defines the summarized income rate, summarized cost rate, and actuarial balance in detail. For any given period, the actuarial balance includes the difference between the present value of non-interest income for the period and the present value of the cost for the period, each divided by the present value of taxable payroll for all years in the period. The computation of the actuarial balance also includes:

- In the reports for 1988 and later, the amount of the trust fund asset reserves on hand at the beginning of the valuation period; and
- In the reports for 1991 and later, the present value of a target trust fund asset reserve equal to 100 percent of the annual cost to be reached and maintained at the end of the valuation period.

Reports of 1973-87 used the average-cost method, a simpler method which approximates the results of the present-value approach for computing the actuarial balance. Under the average-cost method, the sum of the annual cost rates over the 75 -year projection period was divided by the total number of years, 75 , to obtain the average cost rate per year. A similar computation produced the average income rate. The actuarial balance was the difference between the average income rate and the average cost rate.

When the 1973 report introduced the average-cost method, the financing of the program was more nearly on a pay-as-you-go basis over the long-range. Also, the long-range demographic and economic assumptions in that report produced an annual rate of growth in total taxable payroll which was about the same as the annual rate at which the trust funds earned interest. In either circumstance (i.e., pay-as-you-go financing, where the annual income rate is the same as the annual cost rate, or an annual rate of growth in total taxable payroll equal to the annual interest rate), the average-cost method produces

## Appendices

the same result as the present-value method. However, by 1988, neither of these circumstances still existed.

After the 1977 and 1983 Social Security Amendments, projections indicated substantial increases in the trust fund reserves continuing well into the 21st century. These laws changed the program's financing from essentially pay-as-you-go to partial advance funding through the 75 -year period. Also, for the reports from 1973 through 1987, long-range fertility rates and average real wage growth assumptions were gradually reduced, resulting in an annual rate of growth in taxable payroll that was significantly lower than the assumed interest rate by 1987. As a result of the difference between this rate of growth and the assumed interest rate, the results of the average-cost method and the present-value method began to diverge in the reports for 1973 through 1987, and by 1988 they were quite different. While the aver-age-cost method reflected most of the effects of assumed interest rates, it no longer reflected all interest effects. The present-value method, by contrast, accurately reflects the implications of assumed interest rates. As a result, the 1988 report reintroduced the present-value method of calculating the actuarial balance.

A positive actuarial balance indicates that estimated income (plus starting reserves, beginning with the 1988 report) is more than sufficient to meet estimated trust fund obligations (plus the ending target fund, beginning with the 1991 report) for the period as a whole. Even with a positive actuarial balance, it is possible for reserves to become temporarily depleted within the long-range period. An actuarial balance of zero indicates that the estimated income (plus starting reserves, beginning with the 1988 report) exactly matches estimated trust fund obligations (plus the ending target fund, beginning with the 1991 report) for the period as a whole. A negative actuarial balance indicates that estimated income (plus starting reserves, beginning with the 1988 report) is insufficient to meet estimated trust fund obligations (plus the ending target fund, beginning with the 1991 report) for the entire period.

Table VI.B1 contains the long-range OASDI actuarial balances, summarized income rates, and summarized cost rates for the 1982 report through the current report. The reports presented these values on the basis of the intermediate assumptions, which recent reports refer to as alternative II and reports from 1982 to 1990 referred to as alternative II-B.

| Year of report | Summarized income rate | Summarized cost rate | Actuarial balance ${ }^{\text {b }}$ | Change from previous year ${ }^{\text {c }}$ | Year of combined trust fund reserve depletion |

${ }^{a}$ The 1982-90 reports referred to the intermediate assumptions as alternative II-B; the 1991 and later reports refer to the intermediate assumptions as alternative II.
${ }^{\mathrm{b}}$ The definition and method of calculating the actuarial balance were changed in 1988 and 1991. See text for details.
${ }^{\text {c }}$ A detailed year-by-year breakdown of the reasons for the changes in the actuarial balance since the 1983
Trustees Report may be found in Actuarial Note 2024.8 at www.ssa.gov/OACT/NOTES/ran8/.
${ }^{\mathrm{d}}$ Between -0.005 and 0.005 percent of taxable payroll.
${ }^{\mathrm{e}}$ Not projected to become depleted during the 75 -year projection period.
Note: Components may not sum to totals because of rounding.
For several of the years included in the table, significant legislative changes or definitional changes affected the actuarial balance. The Social Security Amendments of 1983 account for the largest single change shown in the table: the actuarial balance of -1.82 for the 1982 report improved to +0.02 for the 1983 report. In 1985, the actuarial balance changed largely because of an adjustment made to the method for estimating the age distribution of immigrants.

Rebenchmarking of the National Income and Product Accounts and changes in demographic assumptions contributed to the change in the actuarial balance for 1987. Various changes in assumptions and methods for the 1988 report had roughly offsetting effects on the actuarial balance. In 1989 and 1990, changes in economic assumptions accounted for most of the changes in the actuarial balance.

In 1991, the effect of legislation, changes in economic assumptions, and the introduction of the cost of reaching and maintaining an ending target trust fund level combined to produce the change in the actuarial balance. In 1992, changes in disability assumptions and the method for projecting average benefit levels accounted for most of the change in the actuarial balance. In 1993, numerous small changes in assumptions and methods had offsetting effects on the actuarial balance. In 1994, changes in the real wage assumptions, disability rates, and the earnings sample used for projecting average benefit levels accounted for most of the change in the actuarial balance. In 1995, numerous small changes had largely offsetting effects on the actuarial bal-
ance, including a substantial reallocation of the payroll tax rate, which reduced the OASI actuarial balance, but increased the DI actuarial balance.

In 1996, a change in the method of projecting dually-entitled beneficiaries produced a large increase in the actuarial balance, which almost totally offset decreases produced by changes in the valuation period and in the demographic and economic assumptions. Various changes in assumptions and methods for the 1997 report had roughly offsetting effects on the actuarial balance. In 1998, increases caused by changes in the economic assumptions, although partially offset by decreases produced by changes in the valuation period and in the demographic assumptions, accounted for most of the changes in the actuarial balance. In 1999, increases caused by changes in the economic assumptions (related to improvements in the CPI by the Bureau of Labor Statistics) accounted for most of the changes in the actuarial balance. For the 2000 report, changes in economic assumptions and methodology caused increases in the actuarial balance, although reductions in the balance caused by the change in valuation period and changes in demographic assumptions partially offset these increases.

For the 2001 report, increases caused by changes in the demographic starting values, although partially offset by a decrease produced by the change in the valuation period, accounted for most of the changes in the actuarial balance. For the 2002 report, changes in the valuation period and the demographic assumptions-both decreases in the actuarial balance-were offset by changes in the economic assumptions, while an increase due to disability assumptions was slightly more than offset by a decrease due to changes in the projection methods and data. For the 2003 report, an increase due to the change in program assumptions was more than offset by decreases due to the change in valuation period and changes in demographic assumptions. In the 2004 report, increases due to changing the method of projecting benefit levels for higher earners more than offset decreases in the actuarial balance arising from the change in the valuation period and the net effect of other changes in programmatic data and methods. For the 2005 report, an increase due to changing the method of projecting future average benefit levels was more than offset by decreases due to changes in the valuation period, updated starting values for the economic assumptions, and other methodological changes.

In 2006, decreases in the actuarial balance due to the change in the valuation period, a reduction in the ultimate annual real interest rate, and improvements in calculating mortality for disabled workers, were greater in aggregate than increases in the actuarial balance due to changes in demographic starting values and the ultimate total fertility rate, as well as other program-

## Appendices

matic data and method changes. For the 2007 report, increases in the actuarial balance arising from revised disability incidence rate assumptions, improvements in average benefit level projections, and changes in near-term economic projections, more than offset decreases in the balance due to the valuation period change and updated historical mortality data. For the 2008 report, the large increase in the actuarial balance was primarily due to changes in immigration projection methods and assumptions. These changes more than offset the decreases in the actuarial balance due to the change in the valuation period and the lower starting and ultimate mortality rates. In 2009, changes in starting values and near-term economic assumptions due to the economic recession, faster ultimate rates of decline in death rates for ages 65-84, and the change in the valuation period accounted for most of the large decrease in the actuarial balance. Legislative changes, in particular the estimated effects of the Patient Protection and Affordable Care Act and the Health Care and Education Reconciliation Act of 2010, were the main reason for the increase in the actuarial balance for the 2010 report. The change in the valuation period partially offset this increase; there were also changes in several assumptions, methods, and recent data which had largely offsetting effects.

For the 2011 report, changes in mortality projections, due to new starting values and revised methods, were the most significant of several factors contributing to the increase in the deficit. In 2012, changes in economic assumptions and starting values accounted for about half of the decrease in actuarial balance. Other factors worsening the actuarial balance were the change in valuation period, changes to starting demographic values, changes to ultimate disability incidence assumptions, and methodology changes and data updates. For the 2013 report, the change in valuation period accounted for the entire net change in the actuarial balance. The effects of substantially lower death rates for 2009 than previously projected and the American Taxpayer Relief Act of 2012 (which lowered the Federal marginal income tax rates) were offset by updates of program-specific data and methodology improvements. In 2014, changes in economic data and assumptions accounted for the majority of the net change in the actuarial balance. Other factors worsening the actuarial balance were the change in the valuation period and various methodology improvements and data updates. For the 2015 report, methodological improvements and updates of programmatic data accounted for the majority of the net increase in the actuarial balance. Also increasing the actuarial balance were a lower ultimate average real wage growth assumption and changes in near-term economic assumptions. These increases were offset somewhat by the change in the valuation period and updates to historical and near-term projected birth rates.

For the 2016 report, the actuarial balance increased primarily due to the effects of the Bipartisan Budget Act of 2015 and improvements made to immigration methods. The most notable immigration change was a revision to the method for projecting emigration of the never-authorized population to reflect lower rates of emigration for those who have resided here longer. These increases in the actuarial balance were largely offset by the effects of changes in ultimate economic assumptions, including a lower real interest rate and a lower annual increase in the rate of price inflation. In 2017, the change in the valuation period and various methodology improvements accounted for most of the net reduction in the actuarial balance. Other economic factors also contributed to worsening the actuarial balance, including a lower real wage growth assumption and an assumed weaker recovery from the recent recession. These reductions were offset somewhat by lower estimated disability incidence rates over the short-range period. For the 2018 report, incorporating the effects of lower-than-expected birth rates, lower near-term fertility assumptions, and the change in the valuation period decreased the actuarial balance. Offsetting these factors to a large degree were the effects of higher-than-expected death rates and several methods improvements, most notably an update to the sample used to project average benefit levels for newly-entitled worker beneficiaries. For the 2019 report, the actuarial balance increased primarily due to higher-than-expected death rates and lower near-term and ultimate disability incidence rate assumptions. Partially offsetting these factors were the effects of a lower ultimate real interest rate assumption and the change in the valuation period. For the 2020 report, the actuarial balance decreased primarily due to the following factors. First, the repeal of the Affordable Care Act's excise tax on employer-sponsored group health insurance premiums reduced projected earnings as a share of employee compensation, having a significant negative financial effect on the trust funds. In addition, lower assumed values for the ultimate total fertility rate, the ultimate rate of price inflation, and the ultimate real interest rate, as compared to the rates assumed for the 2019 report, decreased the actuarial balance.

In 2021, the actuarial balance decreased due to the change in the valuation period and three main additional factors. First, economic assumptions were updated to reflect experience during and following the COVID-19 pandemic. In particular, the levels of productivity and potential GDP were assumed to be roughly 1 percent lower beginning with the second quarter of 2020. Second, the data and methodology used for projecting average benefit levels were updated and improved. Third, data and estimates provided by the Office of Tax Analysis at the Department of the Treasury indicated lower near-term and ultimate levels of taxation of benefits.

## Appendices

For the 2022 report, the actuarial balance increased primarily due to a decrease in the assumed ultimate disability incidence rate, incorporating recent economic data, and changes in near-term economic assumptions. In particular, employment, earnings, and GDP following the 2020 recession recovered much faster than had been assumed in the 2021 report. These disability and economic factors were partially offset by the change in the valuation period and updates for recent demographic data.

In 2023, the actuarial balance decreased primarily due to the change in the valuation period, recent economic experience, and changes in near-term economic assumptions. In particular, the level of potential GDP was assumed to be about 3.0 percent lower by 2026 and for all years thereafter. This shift was made as the Trustees lowered the levels of GDP and total economy labor productivity in response to recent economic developments, including higher-than-expected inflation rates and lower-than-expected output growth.

Section IV.B. 6 describes changes affecting the actuarial balance shown for the 2024 report.

## C. FISCAL YEAR HISTORICAL AND PROJECTED TRUST FUND OPERATIONS THROUGH 2033

Tables VI.C1, VI.C2, and VI.C3 contain details of the fiscal year 2023 operations of the OASI, DI, and the combined OASI and DI Trust Funds, respectively. The fiscal year for the U.S. Government is the 12 -month period ending September 30. Fiscal year 2023 is the most recent fiscal year for which complete information is available. The descriptions of the values in these tables are similar to the corresponding descriptions and values in the calendar year operations tables in section III.A. Please see that section for a description of the various items of income and cost.

Table VI.C1.-Operations of the OASI Trust Fund, Fiscal Year 2023 [In millions]

${ }^{\text {a }}$ The OASI Trust Fund reserves become depleted in fiscal year 2032 under the high-cost assumptions. For any period during which reserves would be depleted, scheduled benefits could not be paid in full on a timely basis, income from taxing benefits would be less than would apply to scheduled benefits, and interest on trust fund reserves would be negligible
${ }^{\mathrm{b}}$ Represents asset reserves at the beginning of a year (which are identical to reserves at the end of the prior year shown in the "Amount at end of year" column) as a percentage of cost for the year.
${ }^{\mathrm{c}}$ Includes adjustments for prior years.
${ }^{d}$ Includes reimbursements from the General Fund of the Treasury to the OASI Trust Fund for: (1) the cost of payroll tax credits provided to employees in 1984 and self-employed persons in 1984-89 by Public Law 98-21;
(and (2) payroll tax revenue forgone under the provisions of Public Laws 111-147, 111-312, 112-78, and 112-96.
Also includes transfers of a portion of proceeds from repayments of loans authorized under Public Law 116-136.
${ }^{\mathrm{e}}$ Revenue from taxation of benefits is the amount that would be assessed on benefit amounts scheduled in law.
${ }^{\mathrm{f}}$ Between - $\$ 50$ million and $\$ 50$ million.
g When the fund reserves are depleted, values under current law would reflect permissible expenditures only, which would be less than the full cost of paying scheduled benefits shown in this table.
Note: Components may not sum to totals because of rounding.

${ }^{\text {a }}$ The OASDI Trust Fund reserves become depleted in fiscal year 2032 under the high-cost assumptions. For any period during which reserves would be depleted, scheduled benefits could not be paid in full on a timely basis, income from taxing benefits would be less than would apply to scheduled benefits, and interest on trust fund reserves would be negligible.
${ }^{\mathrm{b}}$ Represents asset reserves at the beginning of a year (which are identical to reserves at the end of the prior year shown in the "Amount at end of year" column) as a percentage of cost for the year.
${ }^{\mathrm{c}}$ Includes adjustments for prior years.
${ }^{\text {d }}$ Includes reimbursements from the General Fund of the Treasury to the OASI and DI Trust Funds for: (1) the cost of payroll tax credits provided to employees in 1984 and self-employed persons in 1984-89 by Public Law 98-21; and (2) payroll tax revenue forgone under the provisions of Public Laws 111-147, 111-312, 112-78, and 112-96. Also includes transfers of a portion of proceeds from repayments of loans authorized under Public Law 116-136.
${ }^{\mathrm{e}}$ Revenue from taxation of benefits is the amount that would be assessed on benefit amounts scheduled in law.
${ }^{\mathrm{f}}$ Between - $\$ 50$ million and $\$ 50$ million.
g When the fund reserves are depleted, values under current law would reflect permissible expenditures only, which would be less than the full cost of paying scheduled benefits shown in this table.
Note: Components may not sum to totals because of rounding.

## D. LONG-RANGE SENSITIVITY ANALYSIS

This appendix presents estimates that illustrate the sensitivity of the longrange actuarial status of the OASDI program to changes in selected individual assumptions. The estimates based on the three alternative sets of assumptions, which were presented earlier in this report, illustrate the effects of varying all of the principal assumptions simultaneously, in order to portray a significantly more optimistic or pessimistic future. For each sensitivity analysis presented in this appendix, the intermediate alternative II projection is the reference point, and one assumption is varied within that alternative. The variation used for each individual assumption is the same as the level used for that assumption in the low-cost alternative I and high-cost alternative III projections.

Each table in this section shows the effects of changing a particular assumption on the OASDI summarized income rates, summarized cost rates, and actuarial balances for 25-year, 50-year, and 75-year valuation periods. Each table also shows the effects on the annual balance for 2098 and on the year of combined trust fund reserve depletion. Following each table is a discussion of the estimated changes in cost rates. The change in each of the actuarial balances is approximately equal to the change in the corresponding cost rate, but in the opposite direction. This appendix does not discuss income rates following each table because income rates vary only slightly with changes in assumptions that affect revenue from taxation of benefits.

## 1. Total Fertility Rate

Table VI.D1 shows selected measures of OASDI actuarial status on the basis of alternative II with three different assumptions for the future paths of total fertility rates. The Trustees assume that the ultimate total fertility rate will be $1.6,1.9$, and 2.1 children per woman under alternatives III, II, and I, respectively. The ultimate total fertility rate is reached in 2040.

## Appendices

Table VI.D1.——Sensitivity of OASDI Measures to Fertility Assumptions
[As a percentage of taxable payroll]
${ }^{\text {a }}$ The total fertility rate for any year is the average number of children that would be born to a woman if she were to experience, at each age of her life, the birth rate observed in, or assumed for, the selected year, and if she were to survive the entire childbearing period. The ultimate total fertility rate is reached in 2040 under all three alternatives.
${ }^{\mathrm{b}}$ The total fertility rates used for this analysis are consistent with those assumed for the three alternative scenarios. All other assumptions used for this analysis are from alternative II.

For the 25-year period, the cost rate for the three fertility assumptions varies by only about 0.02 percent of taxable payroll. In contrast, the 75-year cost rate varies over a wide range, decreasing from 18.07 percent to 16.81 percent, as the ultimate total fertility rate increases from 1.6 for alternative III to 2.1 for alternative I. Similarly, while the 25 -year actuarial balance varies by only 0.02 percent of taxable payroll, the 75 -year actuarial balance varies over a much wider range, from -4.20 percent to -3.05 percent.

During the 25 -year period, the effects of the very slight increases in the working-age population on tax income resulting from higher fertility (than that experienced in an alternative scenario) are more than offset by the effects of decreases in female labor force participation and increases in the number of child beneficiaries. Therefore, 25 -year program cost as a percent of taxable payroll increases slightly with higher fertility. For the 75 -year long-range period, however, changes in fertility have a relatively greater effect on the working-age population than on the beneficiary population. As a result, an increase in fertility significantly reduces the cost rate. Each increase of 0.1 in the average total fertility rate increases (improves) the long-range actuarial balance by about 0.23 percent of taxable payroll.

## 2. Death Rates

Table VI.D2 shows selected measures of OASDI actuarial status on the basis of alternative II with three different assumptions about future reductions in death rates for the period from 2033 to 2098. These assumptions are described in section V.A.2. Under the Trustees' assumptions, the age-sexadjusted death rates ${ }^{1}$ decline at average annual rates of 0.28 percent, 0.73 percent, and 1.23 percent for alternatives I, II, and III, respectively.

Table VI.D2.-Sensitivity of OASDI Measures to Death-Rate Assumptions

| Valuation period | Average annual death-rate reduction ${ }^{\text {a b }}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 0.28 percent | 0.73 percent | 1.23 percent |
| Summarized income rate: |  |  |  |
| 25-year: 2024-48 | 14.29 | 14.30 | 14.30 |
| 50-year: 2024-73 | 13.88 | 13.90 | 13.93 |
| 75-year: 2024-98 | 13.76 | 13.80 | 13.84 |
| Summarized cost rate: |  |  |  |
| 25-year: 2024-48 | 16.36 | 16.57 | 16.83 |
| 50-year: 2024-73 | 16.47 | 16.96 | 17.55 |
| 75-year: 2024-98 | 16.55 | 17.30 | 18.14 |
| Actuarial balance: |  |  |  |
| 25-year: 2024-48 | -2.07 | -2.28 | -2.53 |
| 50-year: 2024-73 | -2.58 | -3.06 | -3.62 |
| 75-year: 2024-98 | -2.79 | -3.50 | -4.29 |
| Annual balance for 2098 | -3.14 | -4.64 | -6.16 |
| Year of combined trust fund reserve depletion . . . . . . . | 2035 | 2035 | 2035 |

${ }^{\text {a }}$ The average annual death-rate reduction is the average annual geometric rate of decline in the age-sexadjusted death rate for the period from 2033 to 2098.
${ }^{\mathrm{b}}$ The death-rate reductions used for this analysis are consistent with those assumed for the three alternative scenarios. All other assumptions used for this analysis are from alternative II.

The variation in cost for the 25-year period is less pronounced than the variation for the 75-year period because decreases in death rates have cumulative effects. The 25 -year cost rate increases from 16.36 percent (for an average annual death-rate reduction of 0.28 percent from 2033 to 2098) to 16.83 percent (for an average annual death-rate reduction of 1.23 percent from 2033 to 2098). The 75 -year cost rate increases from 16.55 percent to 18.14 percent. The actuarial balance decreases from -2.07 percent to -2.53 percent for the 25 -year period, and from -2.79 percent to -4.29 percent for the 75-year period.
Lower death rates raise both the income (through increased taxable payroll) and the cost of the OASDI program. The relative increase in cost, however,

[^44]
## Appendices

exceeds the relative increase in taxable payroll. For any given year, reductions in the death rates for people who are age 62 and over (ages at which death rates are the highest) increase the number of retired-worker beneficiaries (and, therefore, the amount of retirement benefits paid) without adding significantly to the number of covered workers (and, therefore, to the taxable payroll). Reductions in death rates for people at age 50 to retirement eligibility age result in significant increases to the taxable payroll. However, those increases are not large enough to offset the sum of the additional retirement benefits mentioned above and the disability benefits paid to additional beneficiaries at these pre-retirement ages, which are ages of high disability incidence. At ages under 50 , death rates are so low that even substantial reductions in death rates do not result in significant increases in the numbers of covered workers or beneficiaries. Consequently, if death rates decline by about the same relative amount for all ages, the cost increases faster than the rate of growth in payroll, which results in higher cost rates and lower actuarial balances. Each additional 0.1 -percentage-point increase in the average annual rate of decline in the death rate decreases (worsens) the long-range actuarial balance by about 0.16 percent of taxable payroll.

## 3. Immigration

Table VI.D3 shows selected measures of OASDI actuarial status under alternative II with three different assumptions about the magnitude of total net immigration (sum of net lawful permanent resident (LPR) immigration and net other-than-LPR immigration). See section V.A. 3 for more information on immigration assumptions and methods. Under the Trustees' assumptions, total net annual immigration averages 829,000 persons, $1,244,000$ persons, and $1,683,000$ persons for the period 2034 through 2098 under alternatives III, II, and I, respectively.

Table VI.D3.-Sensitivity of OASDI Measures to Total Net Immigration Assumptions [As a percentage of taxable payroll]

| Valuation period | Average annual total net immigration ${ }^{\text {a }}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 829,000 | 1,244,000 | 1,683,000 |
| Summarized income rate: |  |  |  |
| 25-year: 2024-48 | 14.33 | 14.30 | 14.26 |
| 50-year: 2024-73 | 13.94 | 13.90 | 13.87 |
| 75-year: 2024-98 | 13.85 | 13.80 | 13.76 |
| Summarized cost rate: |  |  |  |
| 25-year: 2024-48 | 16.80 | 16.57 | 16.34 |
| 50-year: 2024-73 | 17.31 | 16.96 | 16.62 |
| 75-year: 2024-98 | 17.75 | 17.30 | 16.87 |
| Actuarial balance: |  |  |  |
| 25-year: 2024-48 | -2.48 | -2.28 | -2.08 |
| 50-year: 2024-73 | -3.37 | -3.06 | -2.76 |
| 75-year: 2024-98 | -3.90 | -3.50 | -3.12 |
| Annual balance for 2098 | -5.49 | -4.64 | -3.93 |
| Year of combined trust fund reserve depletion | 2035 | 2035 | 2035 |

${ }^{\text {a }}$ Average annual total net immigration is the annual total net immigration to the Social Security area, including both LPR and other-than-LPR immigration, averaged for 2034 through 2098.
${ }^{\mathrm{b}}$ The total net immigration assumptions used for this analysis are consistent with those assumed for the three alternative scenarios. All other assumptions used for this analysis are from alternative II.

For all three periods, when total net immigration increases, the cost rate decreases. For the 25 -year period, the cost rate decreases from 16.80 percent of taxable payroll (for average annual total net immigration of 829,000 persons for 2034 through 2098) to 16.34 percent (for an average annual total net immigration of $1,683,000$ persons for 2034 through 2098). For the 50 -year period, it decreases from 17.31 percent to 16.62 percent, and for the 75 -year period, it decreases from 17.75 percent to 16.87 percent. The actuarial balance increases from -2.48 percent to -2.08 percent for the 25 -year period, from -3.37 percent to -2.76 percent for the 50 -year period, and from -3.90 percent to -3.12 percent for the 75 -year period.

The cost rate decreases with an increase in total net immigration because immigration occurs at relatively young ages, thereby increasing the numbers of covered workers earlier than the numbers of beneficiaries. Increasing average annual total net immigration by 100,000 persons increases (improves) the long-range actuarial balance by about 0.09 percent of taxable payroll.

## 4. Real Wage Growth

Table VI.D4 shows selected measures of OASDI actuarial status on the basis of alternative II with three different assumptions about the real growth rate in the average annual wage in OASDI covered employment. Under the Trust-

## Appendices

ees' assumptions, the average annual real growth rate in the average wage in covered employment from 2033 to 2098 is 0.53 percent, 1.14 percent, and 1.74 percent under alternatives III, II, and I, respectively.

Table VI.D4.-Sensitivity of OASDI Measures to Real Wage Growth Assumptions
[As a percentage of taxable payroll]
${ }^{\text {a }}$ The average annual real wage growth is the average annual real growth rate in the average wage in OASDI covered employment from 2033 to 2098.
${ }^{\mathrm{b}}$ The real wage growth assumptions used for this analysis are consistent with those assumed for the three alternative scenarios. All other assumptions used for this analysis are from alternative II.

For the 25-year period, the cost rate decreases from 17.39 percent (for a real growth rate in the average wage in OASDI covered employment of 0.53 percent) to 15.76 percent (for a real growth rate of 1.74 percent). For the 50 -year period, it decreases from 18.16 percent to 15.78 percent, and for the 75 -year period it decreases from 18.64 percent to 15.97 percent. The actuarial balance increases from -2.99 percent to -1.57 percent for the 25-year period, from -4.11 percent to -2.02 percent for the 50 -year period, and from -4.68 percent to -2.32 percent for the 75 -year period.
The cost rate decreases with increasing real wage growth. Higher wages increase taxable payroll immediately, but they increase benefit levels only gradually as new beneficiaries become entitled. In addition, cost-of-living adjustments (COLA) to benefits depend not on changes in wages, but on changes in prices. Each 0.1-percentage-point increase in real wage growth increases (improves) the long-range actuarial balance by about 0.19 percent of taxable payroll.

## 5. Consumer Price Index

Table VI.D5 shows selected measures of OASDI actuarial status on the basis of alternative II with three different assumptions about the rate of increase for the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI). Under the Trustees' assumptions, the annual increase in the CPI is 3.00 percent, 2.40 percent, and 1.80 percent under alternatives I, II, and III, respectively. These ultimate rates of increase are reached by 2026 under all three alternatives.

Table VI.D5.-Sensitivity of OASDI Measures to CPI-Increase Assumptions

| Valuation period | Ultimate annual increase in $\mathrm{CPI}^{\text {a }}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 3.00 | 2.40 | 1.80 |
| Summarized income rate: |  |  |  |
| 25-year: 2024-48 | 14.28 | 14.30 | 14.31 |
| 50-year: 2024-73 | 13.89 | 13.90 | 13.92 |
| 75-year: 2024-98 . . . . . . . . . . . . . . . . . . . . . . . . . . . . . | 13.79 | 13.80 | 13.81 |
| Summarized cost rate: |  |  |  |
| 25-year: 2024-48 | 16.47 | 16.57 | 16.67 |
| 50-year: 2024-73 | 16.83 | 16.96 | 17.10 |
| 75-year: 2024-98 . . . . . . . . . . . . . . . . . . . . . . . . . . . . | 17.14 | 17.30 | 17.44 |
| Actuarial balance: |  |  |  |
| 25-year: 2024-48 | -2.19 | -2.28 | -2.36 |
| 50-year: 2024-73 | -2.94 | -3.06 | -3.18 |
| 75-year: 2024-98 | -3.36 | -3.50 | -3.63 |
| Annual balance for 2098 | -4.45 | -4.64 | -4.81 |
| Year of combined trust fund reserve depletion . . . . . . . | 2035 | 2035 | 2035 |

${ }^{\text {a }}$ The CPI assumptions used for this analysis are consistent with those assumed for the three alternative scenarios. All other assumptions used for this analysis are from alternative II.

For all three periods, the cost rate increases when the assumed rates of increase in the CPI are smaller. For the 25 -year period, the cost rate increases from 16.47 percent (for a CPI increase of 3.00 percent) to 16.67 percent (for a CPI increase of 1.80 percent). For the 50 -year period, it increases from 16.83 percent to 17.10 percent, and for the 75 -year period, it increases from 17.14 percent to 17.44 percent. The actuarial balance decreases from -2.19 percent to -2.36 percent for the 25 -year period, from -2.94 percent to -3.18 percent for the 50 -year period, and from -3.36 percent to -3.63 percent for the 75 -year period.

The time lag between the effects of the CPI changes on taxable payroll and on scheduled benefits explains these patterns. When the rate of increase in the CPI is greater and real wage growth is constant, then: (1) the effect on taxable payroll due to a greater rate of increase in average wages occurs immediately and (2) the effect on benefits due to a larger COLA occurs with

## Appendices

a lag of about 1 year. As a result of these effects, the higher taxable payrolls have a stronger effect than the higher benefits, which results in lower cost rates. Each 0.1-percentage-point decrease in the rate of the change in the CPI decreases (worsens) the long-range actuarial balance by about 0.02 percent of taxable payroll.

## 6. Real Interest Rate

Table VI.D6 shows selected measures of OASDI actuarial status under alternative II with three different assumptions about the annual real interest rate (compounded semiannually) for special public-debt obligations issuable to the trust funds. Under the Trustees' assumptions, the ultimate annual real interest rate is 1.8 percent, 2.3 percent, and 2.8 percent under alternatives III, II, and I, respectively. These ultimate rates are reached by 2041 under all three alternatives. In each case, the ultimate annual increase in the CPI is 2.40 percent, which is consistent with alternative II. Therefore, the ultimate annual yields are $4.2,4.8$, and 5.3 percent, respectively.

Table VI.D6.-Sensitivity of OASDI Measures to Real Interest Rate Assumptions

| Valuation period | Ultimate annual real interest rate ${ }^{\mathrm{a} \mathrm{b}}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 1.8 percent | 2.3 percent | 2.8 percent |
| Summarized income rate: |  |  |  |
| 25-year: 2024-48 | 14.26 | 14.30 | 14.33 |
| 50-year: 2024-73 | 13.86 | 13.90 | 13.95 |
| 75-year: 2024-98 | 13.75 | 13.80 | 13.85 |
| Summarized cost rate: |  |  |  |
| 25-year: 2024-48 | 16.63 | 16.57 | 16.52 |
| 50-year: 2024-73 | 17.07 | 16.96 | 16.87 |
| 75-year: 2024-98 | 17.44 | 17.30 | 17.16 |
| Actuarial balance: |  |  |  |
| 25-year: 2024-48 | -2.37 | -2.28 | -2.19 |
| 50-year: 2024-73 | -3.21 | -3.06 | -2.91 |
| 75-year: 2024-98 | -3.69 | -3.50 | -3.31 |
| Annual balance for 2098 | -4.64 | -4.64 | -4.64 |
| Year of combined trust fund reserve depletion . . . . . . . | 2035 | 2035 | 2035 |

${ }^{\text {a }}$ The annual real interest rate is the effective annual yield on asset reserves held by the trust funds divided by the annual rate of growth in the CPI.
${ }^{\mathrm{b}}$ The real interest rate assumptions used for this analysis are consistent with those assumed for the three alternative scenarios. All other assumptions used for this analysis are from alternative II.

For the 25 -year period, the cost rate decreases with increasing real interest rates from 16.63 percent (for an ultimate real interest rate of 1.8 percent) to 16.52 percent (for an ultimate real interest rate of 2.8 percent). For the 50 -year period, it decreases from 17.07 percent to 16.87 percent and, for the 75 -year period, it decreases from 17.44 percent to 17.16 percent. The actuar-
ial balance increases from -2.37 percent to -2.19 percent for the 25 -year period, from -3.21 percent to -2.91 percent for the 50 -year period, and from -3.69 percent to -3.31 percent for the 75 -year period. A relatively higher real interest rate has the effect of discounting more distant future years relatively more. To the extent that annual cost rates and annual deficits are larger in later years, a higher interest rate decreases the summarized rates, and a lower interest rate increases the summarized rates. Each 0.1-percentage-point increase in the real interest rate increases (improves) the long-range actuarial balance by about 0.04 percent of taxable payroll.

## 7. Taxable Ratio

Table VI.D7 shows selected measures of OASDI actuarial status under alternative II with three different assumptions about the ratio of taxable payroll to OASDI covered earnings (the taxable ratio). Note that covered earnings are the sum of wages and net self-employment earnings covered by Social Security, and taxable payroll is essentially the amount of covered earnings subject to the Social Security payroll tax up to the contribution and benefit base ( $\$ 168,600$ for 2024). Under the Trustees' assumptions, the taxable ratio at the end of the short-range period (2033) is 81.0 percent, 82.5 percent, and 84.0 percent under alternatives III, II, and I, respectively.

Table VI.D7.-Sensitivity of OASDI Measures to Taxable Ratio Assumptions

| Valuation period | Taxable ratio in 2033 ${ }^{\text {a b }}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 81.0 percent | 82.5 percent | 84.0 percent |
| Summarized income rate: |  |  |  |
| 25-year: 2024-48 | 14.32 | 14.30 | 14.27 |
| 50-year: 2024-73 | 13.93 | 13.90 | 13.88 |
| 75-year: 2024-98 | 13.82 | 13.80 | 13.78 |
| Summarized cost rate: |  |  |  |
| 25-year: 2024-48 | 16.81 | 16.57 | 16.34 |
| 50-year: 2024-73 | 17.18 | 16.96 | 16.75 |
| 75-year: 2024-98 | 17.49 | 17.30 | 17.11 |
| Actuarial balance: |  |  |  |
| 25-year: 2024-48 | -2.48 | -2.28 | -2.08 |
| 50-year: 2024-73 | -3.26 | -3.06 | -2.87 |
| 75-year: 2024-98 | -3.68 | -3.50 | -3.33 |
| Annual balance for 2098 | -4.76 | -4.64 | -4.52 |
| Year of combined trust fund reserve depletion . . . . . . . | 2034 | 2035 | 2036 |

${ }^{\text {a }}$ The taxable ratio is the ratio of taxable payroll to OASDI covered earnings. These concepts are described in further detail in section V.C. 6 of this report.
${ }^{\mathrm{b}}$ The taxable ratio assumptions used for this analysis are consistent with those assumed for the three alternative scenarios. All other assumptions used for this analysis are from alternative II.

## Appendices

Because the combined employee-employer tax rate of 12.4 percent is unchanged across all alternatives, the income rate changes a relatively small amount as the taxable ratio increases, due to changes in taxation of benefits and the initial fund as a percentage of taxable payroll.
For the 25-year period, the cost rate decreases with increasing taxable ratios, from 16.81 percent (for a taxable ratio in 2033 of 81.0 percent) to 16.34 percent (for a taxable ratio in 2033 of 84.0 percent). For the 50 -year period, it decreases from 17.18 percent to 16.75 percent and, for the 75 -year period, it decreases from 17.49 percent to 17.11 percent. The actuarial balance increases from -2.48 percent to -2.08 percent for the 25 -year period, from -3.26 percent to -2.87 percent for the 50 -year period, and from -3.68 percent to -3.33 percent for the 75 -year period.

The cost rate decreases with an increase in taxable payroll because the increase in taxable payroll occurs immediately. The increase in benefit amounts occurs much more gradually as new beneficiaries become entitled. In addition, the change in the taxable ratio does not affect COLAs or the national average wage index. Each 1.0 percentage-point increase in the taxable ratio in 2033 increases (improves) the long-range actuarial balance by about 0.12 percent of taxable payroll.

## 8. Disability Incidence Rates

Table VI.D8 shows selected measures of OASDI actuarial status on the basis of alternative II with three different assumptions about future disability incidence rates. Under the Trustees' assumptions, the ultimate age-sex-adjusted ${ }^{1}$ incidence rate is $3.6,4.5$, and 5.4 awards per thousand exposed for alternatives I, II, and III, respectively. These ultimate rates are reached by 2033 under all three alternatives. Under the Trustees' assumptions, incidence rates by age and sex for all three alternatives vary during the early years of the projection period before reaching their long-term average values.

[^45]| Valuation period | Ultimate disability incidence rate ${ }^{\text {a }}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 3.6 | 4.5 | 5.4 |
| Summarized income rate: |  |  |  |
| 25-year: 2024-48 | 14.28 | 14.30 | 14.31 |
| 50-year: 2024-73 | 13.89 | 13.90 | 13.92 |
| 75-year: 2024-98 | 13.79 | 13.80 | 13.81 |
| Summarized cost rate: |  |  |  |
| 25-year: 2024-48 | 16.29 | 16.57 | 16.86 |
| 50-year: 2024-73 | 16.63 | 16.96 | 17.30 |
| 75-year: 2024-98 | 16.95 | 17.30 | 17.65 |
| Actuarial balance: |  |  |  |
| 25-year: 2024-48 | -2.00 | -2.28 | -2.55 |
| 50-year: 2024-73 | -2.74 | -3.06 | -3.38 |
| 75-year: 2024-98 | -3.16 | -3.50 | -3.84 |
| Annual balance for 2098 | -4.23 | -4.64 | -5.10 |
| Year of combined trust fund reserve depletion | 2036 | 2035 | 2034 |

${ }^{\text {a }}$ The disability incidence rates used for this analysis are consistent with those assumed for the three alternative scenarios. All other assumptions used for this analysis are from alternative II.

For the 25-year period, the cost rate increases with increasing disability incidence rates, from 16.29 percent (for the relatively low rates assumed for alternative I) to 16.86 percent (for the relatively high rates assumed for alternative III). For the 50 -year period, it increases from 16.63 percent to 17.30 percent, and for the 75 -year period, it increases from 16.95 percent to 17.65 percent. The actuarial balance decreases from -2.00 percent to -2.55 percent for the 25 -year period, from -2.74 percent to -3.38 percent for the 50 -year period, and from -3.16 percent to -3.84 percent for the 75 -year period.

## 9. Disability Termination Rates

Table VI.D9 shows selected measures of OASDI actuarial status on the basis of alternative II with three different assumptions about future disability termination rates, including deaths and recoveries.

Under the Trustees' assumptions, death rates for disabled-worker beneficiaries for all three alternatives decline throughout the long-range period. The age-sex-adjusted death rate ${ }^{1}$ of 26.8 deaths per thousand disabled-worker beneficiaries in 2023 declines to $21.5,12.4$, and 6.2 deaths per thousand in 2098 for alternatives I, II, and III, respectively. These levels are about 20 percent, 54 percent, and 77 percent lower, respectively, than the level in

[^46]
## Appendices

2023. For this sensitivity analysis, total population death rates by age and sex are assumed to be the same as those used for the alternative II assumptions.

The ultimate age-sex-adjusted recovery rate ${ }^{1}$ used for this analysis is 13.0 recoveries per thousand disabled-worker beneficiaries for the alternative I assumptions, 10.8 recoveries per thousand disabled-worker beneficiaries for the alternative II assumptions, and 8.6 recoveries per thousand disabled-worker beneficiaries for the alternative III assumptions.

Table VI.D9.-Sensitivity of OASDI Measures to Disability Termination Assumptions

| Valuation period | Disability termination rates (death; recovery) ${ }^{\mathrm{a}}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 21.5; 13.0 | 12.4;10.8 | 6.2; 8.6 |
| Summarized income rate: |  |  |  |
| 25-year: 2024-48 | 14.29 | 14.30 | 14.30 |
| 50-year: 2024-73 | 13.90 | 13.90 | 13.90 |
| 75-year: 2024-98 | 13.80 | 13.80 | 13.80 |
| Summarized cost rate: |  |  |  |
| 25-year: 2024-48 | 16.52 | 16.57 | 16.62 |
| 50-year: 2024-73 | 16.90 | 16.96 | 17.01 |
| 75-year: 2024-98 | 17.22 | 17.30 | 17.35 |
| Actuarial balance: |  |  |  |
| 25-year: 2024-48 | -2.23 | -2.28 | -2.32 |
| 50-year: 2024-73 | -3.00 | -3.06 | -3.11 |
| 75-year: 2024-98 | -3.42 | -3.50 | -3.55 |
| Annual balance for 2098 | -4.50 | -4.64 | -4.74 |
| Year of combined trust fund reserve depletion | 2035 | 2035 | 2035 |

${ }^{\text {a }}$ The disability termination rates used for this analysis are consistent with those assumed for the three alternative scenarios. All other assumptions used for this analysis are from alternative II.

For the 25-year period, the cost rate increases with decreasing disability termination rates, from 16.52 percent (for the relatively high termination rates assumed for alternative I) to 16.62 percent (for the relatively low termination rates assumed for alternative III). For the 50 -year period, it increases from 16.90 percent to 17.01 percent, and for the 75 -year period, it increases from 17.22 percent to 17.35 percent. The actuarial balance decreases from -2.23 percent to -2.32 percent for the 25 -year period, from -3.00 percent to -3.11 percent for the 50 -year period, and from -3.42 percent to -3.55 percent for the 75 -year period.

[^47]
## E. STOCHASTIC PROJECTIONS AND UNCERTAINTY

Significant uncertainty surrounds the estimates under the intermediate assumptions, especially for a period as long as 75 years. This appendix presents stochastic projections, a way to illustrate the uncertainty of these estimates. The stochastic projections supplement the traditional methods of examining such uncertainty.

## 1. Background

The Trustees have traditionally shown estimates using the low-cost and highcost sets of specified assumptions to illustrate the potential implications of uncertainty. These low-cost and high-cost estimates provide a range of possible outcomes for the projections. However, they do not provide an indication of the probability that actual future experience will be inside or outside this range. This appendix presents the results of a stochastic model that estimates a probability distribution of future outcomes of the financial status of the combined OASI and DI Trust Funds. This model was introduced in the 2003 report and enhanced in the 2021 report to include parameter uncertainty for the expected mean for the key variables described in the next section.

## 2. Stochastic Methodology

Other sections of this report provide estimates of the financial status of the combined OASI and DI Trust Funds using a scenario-based model. For the scenario-based model, the Trustees use three alternative scenarios (low-cost, intermediate, and high-cost) that use specific assumptions for key variables. In general, the Trustees assume that each of these variables will reach an ultimate value at a specific point during the long-range period, and will maintain that value throughout the remainder of the period. The three alternative scenarios assume separate, specified values for each of these variables. Chapter V contains more details about each of these assumptions.

This appendix presents estimates of the probability that key measures of OASDI solvency will fall in certain ranges, based on 5,000 independent stochastic simulations. Each simulation allows key variables to vary throughout the long-range period. These key variables include total fertility rates, changes in mortality rates, new arrival lawful permanent resident (LPR) and other-than-LPR immigration levels, rates of adjustment of status (from other-than-LPR to LPR), rates of legal emigration (from the population of citizens and LPRs), changes in the Consumer Price Index, changes in average real wages, unemployment rates, trust fund real yield rates, and disability incidence and recovery rates. The fluctuation of each variable over time is simu-

## Appendices

lated using historical data and standard time-series techniques. Generally, each variable is modeled using an equation that: (1) captures a relationship between current and prior years' values of the variable, and (2) introduces random variation based on variation observed in the historical period. For some variables, the equations also reflect relationships with other variables. The equations contain parameters that are estimated using historical data for periods from about 20 years to over 100 years, depending on the nature and quality of the available data. Each time-series equation is designed so that, in the absence of random variation over time, the value of the variable for each year equals its value for the intermediate scenario. ${ }^{1}$

For each equation in a given simulation, the stochastic model assigns random variation to (1) year-by-year error term values and (2) simulation-specific mean term levels that provide variation in the central tendency across simulations. Each simulation produces estimates for all key variables and for the overall financial status of the combined OASI and DI Trust Funds. This appendix shows the distribution of results from 5,000 simulations of the model.

Readers should interpret the results from this model with an understanding of the model's limitations. Results are sensitive to equation specifications, degrees of interdependence among variables, and the historical periods used for estimating model coefficients. For some variables, recent historical variation may not provide a realistic representation of the potential variation for the future. Also, results would differ if additional variables (such as labor force participation rates, retirement rates, marriage rates, and divorce rates) were also allowed to vary randomly. Time-series modeling reflects only what occurred in the historical period. Future uncertainty exists not only for the underlying central tendency but also for the frequency and size of occasional longer-term shifts in the central tendency. Many experts predict, and history suggests, that the future will likely bring substantial shifts that are not fully reflected in the historical period used for the current model. As a result, readers should understand that the true range of uncertainty might be larger than indicated in this appendix.

## 3. Stochastic Results

This section illustrates the results for the stochastic simulations of two fundamental measures of actuarial status: annual cost rates and trust fund ratios. The latter measure is highlighted in section II.D of this report. Section 4 of

[^48]this appendix follows with a comparison of stochastic results to results from the alternative scenarios for these and other measures, and an analysis of the differences.

Figure VI.E1 displays the probability distribution of the year-by-year OASDI cost rates (that is, cost as a percentage of taxable payroll). The range of the annual cost rates widens as the projections move further into the future, which reflects increasing uncertainty. The figure includes only the income rate for the intermediate scenario rather than the probability distribution of the year-by-year income rates, because there is relatively little variation in income rates across the 5,000 stochastic simulations. The two outermost cost rate lines in this figure indicate the range within which future annual cost rates are projected to occur 95 percent of the time. In other words, the current model estimates that there is a 2.5 percent probability that the cost rate for a given year will exceed the upper end of this range and a 2.5 percent probability that it will fall below the lower end of this range. Other lines in the figure delineate the range within which future annual cost rates are projected to occur 80 percent of the time and the median cost rate. The median (50th percentile) cost rate for each year is the rate for which half of the simulated outcomes are higher and half are lower for that year. These lines do not represent the results of individual stochastic simulations. Instead, for each given year, they represent the percentile distribution of annual cost rates based on all stochastic simulations for that year.

## Appendices

Figure VI.E2 presents the simulated probability distribution of the annual trust fund ratios for the combined OASI and DI Trust Funds. The lines in this figure display the median set (50th percentile) of estimated annual trust fund ratios and delineate the 95 -percent and 80-percent ranges estimated for future annual trust fund ratios. Again, none of these lines represent the path of a single simulation. For each given year, they represent the percentile distribution of trust fund ratios based on all stochastic simulations for that year.

Figure VI.E2 shows that for 95 percent of the stochastic simulations, the trust fund reserve depletion year falls in the range from 2032 to 2043, relatively early in the 75 -year projection period. The figure also shows that there is a 50-percent probability of trust fund reserve depletion by the end of 2035 (the median reserve depletion year). The median reserve depletion date is early in 2035; the reserve depletion date for the intermediate scenario is in mid-2035.

Figure VI.E2.-Long-Range OASI and DI Combined Trust Fund Ratios From Stochastic Modeling

4. Comparison of Results: Stochastic to Low-Cost, Intermediate, and High-Cost Alternative Scenarios

This section compares results from two different approaches for illustrating ranges of uncertainty in measures of trust fund actuarial status. One approach uses results from the low-cost, intermediate, and high-cost alternative scenarios. The other approach uses distributions of results from the stochastic simulations. Each of these approaches provides insights into uncertainty. Comparing the results requires an understanding of fundamental differences in the approaches.

One fundamental difference relates to the presentation of distributional results. Figure VI.E3 shows projected OASDI annual cost rates for the lowcost, intermediate, and high-cost alternative scenarios along with the annual cost rates at the 2.5 th percentile, 50th percentile, and 97.5 th percentile for the stochastic simulations. While all values on each line for the alternative scenarios are results from a single specified scenario, the values on each stochastic line may be results from different simulations for different years. The one stochastic simulation (from the 5,000 simulations) that yields results

## Appendices

closest to a particular percentile for one projected year may yield results that are distant from that percentile in another projected year.

Results for both the set of alternative scenarios and the set of stochastic simulations suggest that the range of potential cost rates above the central levels (those for the intermediate scenario and for the stochastic median, respectively) is larger than the range below these central results. The difference between the central results and the higher cost levels (the high-cost alternative scenario and the upper end of the 95-percent stochastic simulation range, respectively) is about 1.6 to 1.8 times as large as the difference between the central and lower cost levels for both models by the end of the projection period.

Figure VI.E3.-OASI and DI Combined Cost Rates: Comparison of Stochastic to Low-Cost, Intermediate, and High-Cost Alternative Scenarios
[As a percentage of taxable payroll]

Another fundamental difference between the alternative scenarios and the stochastic simulations is the method of assigning values for assumptions. For the alternative scenarios, specific values are assigned for each of the key demographic, economic, and program-specific variables. The high-cost alternative scenario uses parameter values that increase estimated annual cost as a percent of payroll, while the low-cost alternative scenario uses parameter values that decrease annual cost as a percent of payroll. (One parameter, the
interest rate, has no effect on annual cost as a percent of payroll for either the alternative scenarios or the stochastic simulations.) In contrast, the stochastic method independently assigns random variation to each of the key demographic, economic, and program-specific variables for each year in each of the 5,000 stochastic simulations. The assigned values for different variables result in varying, and often offsetting, effects on projected cost as a percent of payroll, with some tending toward higher cost and some tending toward lower cost. This difference tends to narrow the range of cost as a percent of payroll across the 95 -percent stochastic simulation range, relative to the range for the alternative scenarios.

It is important to understand that the stochastic model's 95 -percent range for any summary measure of trust fund finances would tend to be narrower than the range produced for the low-cost and high-cost alternative scenarios, even if the stochastic model's 95 -percent range for annual cost rates were identical to the range defined by the low-cost and high-cost scenarios. This is true because summary measures of trust fund finances depend on cost rates for many years, and the probability that annual cost rates, on average for individual stochastic simulations, will be at least as low (high) as the 2.5 th ( 97.5 th) percentile line is significantly lower than 2.5 percent. As a result, the relationship between the ranges presented for annual cost rates and summary measures of trust fund finances is fundamentally different for the stochastic model than it is for the low-cost and high-cost alternative scenarios.

Figure VI.E4 compares the ranges of trust fund (unfunded obligation) ratios for the alternative scenarios to the 95 -percent range of the stochastic simulations. This figure extends figure VI.E2 to show unfunded obligation ratios, expressed as negative values below the zero percent line. An unfunded obligation ratio is the ratio of the unfunded obligation accumulated through the beginning of the year to the cost for that year.

## Appendices

Figure VI.E4.-OASI and DI Combined Trust Fund (Unfunded Obligation) Ratios: Comparison of Stochastic to Low-Cost, Intermediate, and High-Cost Alternative Scenarios ${ }^{\text {a }}$
[Trust fund reserves (unfunded obligation) as a percentage of annual cost]

${ }^{\text {a }}$ An unfunded obligation, shown as a negative value in this figure, is equivalent to the amount the trust funds would need to have borrowed to date in order to pay all scheduled benefits (on a timely basis) after trust fund reserves are depleted. Note that current law does not permit the trust funds to borrow.

As mentioned above, a summary measure that accumulates annual values tends to smooth the kind of annual fluctuations that occur in stochastic simulations. Therefore, one might expect the stochastic range for trust fund (unfunded obligation) ratios to be narrower and fall within the range seen across the high-cost and low-cost alternative scenarios, as it does for the actuarial balance measure (as shown in table VI.E1, below). But this is not the case, largely due to the way interest rates are assigned.

For the stochastic model, real interest rates for each simulation are assigned to be essentially independent of other variables, so the rate for compounding of trust fund reserves (unfunded obligations) is essentially uncorrelated with the level of cost as a percent of payroll. On the other hand, real interest rates are assigned to be higher for the low-cost alternative scenario and lower for the high-cost alternative scenario. High interest rates raise the level of the positive trust fund ratio in the low-cost alternative scenario somewhat, but this effect is limited because the magnitude of reserves is small. However, low interest rates substantially reduce the magnitude of the unfunded obligation ratio for the high-cost alternative scenario because the magnitude of
unfunded obligations is relatively large. As a result, the trust fund (unfunded obligation) ratios are shifted, albeit unevenly, higher (or less negative) for both the high-cost and low-cost alternative scenarios relative to those of the stochastic simulations.

This interest rate effect on the alternative scenarios is not as evident for some other summary measures of actuarial status, such as the actuarial balance. Because the actuarial balance reflects the cumulative effects of interest in both its numerator and denominator, the interest rate effect is much less pronounced. In contrast, cumulative interest affects only the numerator of the trust fund (unfunded obligation) ratio. There is also no significant interest rate effect on the trust fund depletion date.

Other factors also contribute, to varying degrees, to the difference in ranges between the results of the alternative scenarios and the stochastic simulations. The contrasts in results and methods do not mean that either approach to illustrating ranges of uncertainty is superior to the other. The ranges are different and explainable.

Table VI.E1 displays long-range actuarial estimates for the combined OASDI program using the two methods of illustrating uncertainty: alternative scenarios and stochastic simulations. The table shows scenario-based estimates for the intermediate, low-cost, and high-cost assumptions. It also shows stochastic estimates for the median (50th percentile) and for the 80 -percent and 95 -percent ranges. Each individual stochastic estimate in the table is the level at that percentile from the distribution of the 5,000 simulations. For each given percentile, the values in the table for each long-range actuarial measure are generally from different stochastic simulations.

The median stochastic estimates displayed in table VI.E1 are similar to the intermediate scenario-based estimates. The median estimate of the longrange actuarial balance is -3.54 percent of taxable payroll, about 0.04 percentage point lower (more negative) than projected in the intermediate scenario. The median estimate for the open-group unfunded obligation is $\$ 22.6$ trillion, which is equal to the estimate in the intermediate scenario. The median first projected year for which cost exceeds non-interest income (as it did in 2010 through 2023), and remains in excess of non-interest income throughout the remainder of the long-range period, is 2024 . This is the same year as projected in the intermediate scenario. The median projected date at which trust fund reserves first become depleted is early in 2035; the reserve depletion date for the intermediate scenario is mid-2035. The median estimates of the annual cost rate for the 75 th year of the projection period are 18.65 percent of taxable payroll and 6.26 percent of gross domestic product

## Appendices

(GDP). The comparable estimates in the intermediate scenario are 18.12 percent of payroll and 6.10 percent of GDP.

For three measures in table VI.E1 (the actuarial balance, the first projected year cost exceeds non-interest income and remains in excess through 2098, and the first year trust fund reserves become depleted), the 95 -percent stochastic range falls within the range defined by the low-cost and high-cost scenarios. For the remaining three measures (the open-group unfunded obligation, the annual cost in the 75th year as a percent of taxable payroll, and the annual cost in the 75th year as a percent of GDP), one or both of the bounds of the 95-percent stochastic range fall outside the range defined by the low-cost and high-cost scenarios.

Table VI.E1.-Long-Range Estimates Relating to the Actuarial Status of the Combined OASDI Program
[Comparison of scenario-based and stochastic results]

|  | Traditional scenario-based model |  |  | Stochastic model |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Intermediate | Low-cost | High-cost | $\begin{array}{r} \text { Median } \\ 50 \text { th } \\ \text { percentile } \end{array}$ | 80-percent range |  | 95-percent range |  |
|  |  |  |  |  | 10th percentile | 90th percentile | $2.5 \mathrm{th}$ <br> percentile | 97.5th centile |
| Actuarial balance | -3.50 | -0.07 | -8.24 | -3.54 | -5.61 | -1.92 | -6.99 | -1.10 |
| Open-group unfunded obligation (in trillions). . . . . . | \$22.6 | -\$.7 | \$44.9 | \$22.6 | \$10.3 | \$45.6 | \$5.5 | \$63.2 |
| First projected year cost exceeds non-interest income and remains in excess through 2098. | 2024 | a | 2024 | 2024 | 2024 | 2038 | 2024 | b |
| First year trust fund reserves become depleted ${ }^{\text {c }}$ | 2035 | 2080 | 2032 | 2035 | 2033 | 2039 | 2032 | 2043 |
| Annual cost in 75th year (percent of taxable payroll) | 18.12 | 12.55 | 28.25 | 18.65 | 14.51 | 24.68 | 12.61 | 29.01 |
| Annual cost in 75th year (percent of GDP). | 6.10 | 4.61 | 8.76 | 6.26 | 4.91 | 8.21 | 4.26 | 9.55 |

${ }^{\text {a }}$ Cost is projected to exceed non-interest income for a temporary period, before falling below non-interest income by the end of the projection period.
${ }^{\mathrm{b}}$ Cost does not exceed non-interest income in 2098.
${ }^{\mathrm{c}}$ For the low-cost scenario and for some stochastic simulations, the first year in which trust fund reserves become depleted does not indicate a permanent depletion of reserves.

## F. INFINITE HORIZON PROJECTIONS

Another measure of trust fund financial status is the infinite horizon unfunded obligation, which takes account of all past and future annual balances, even those after the next 75 years. The extension of the time period past 75 years assumes that the current law for the OASDI program and the demographic and economic trends used for the 75 -year projection continue indefinitely.

Table VI.F1 shows that the OASDI open-group unfunded obligation over the infinite horizon is $\$ 62.8$ trillion in present value, which is $\$ 40.2$ trillion larger than for the 75 -year period. The $\$ 40.2$ trillion increment reflects a significant financing gap projected for OASDI for years after 2098 into perpetuity. Of course, the degree of uncertainty associated with estimates increases substantially for years further in the future.

The $\$ 62.8$ trillion infinite horizon open-group unfunded obligation is equal to 4.5 percent of taxable payroll or 1.4 percent of GDP over the same period. These relative measures of the unfunded obligation over the infinite horizon express its magnitude in relation to the resources potentially available to finance the shortfall.

The summarized shortfalls for the 75 -year period and through the infinite horizon both reflect annual cash-flow shortfalls for all years after trust fund reserve depletion. The annual shortfalls after trust fund reserve depletion rise slowly and reflect increases in life expectancy. The summarized shortfalls over the infinite horizon, as percentages of taxable payroll and GDP, are larger than the shortfalls for the 75-year period.

To illustrate the magnitude of the projected infinite horizon shortfall, consider that it could be eliminated with additional revenue equivalent to an immediate increase in the combined payroll tax rate from 12.4 percent to about 17.0 percent, ${ }^{1}$ or with cost reductions equivalent to an immediate and permanent reduction in benefits for all current and future beneficiaries by about 26.5 percent.

[^49]
# Table VI.F1.-Unfunded OASDI Obligations Through the Infinite Horizon and 

 the 75-Year Projection Period, Based on Intermediate Assumptions [Present values as of January 1, 2024; dollar amounts in trillions]|  | Present value | Expressed as a percentage of future payroll and GDP |  |
| :---: | :---: | :---: | :---: |
|  |  | Taxable payroll | GDP |
| Unfunded obligation through the infinite horizon ${ }^{\text {a }}$ | \$62.8 | 4.5 | 1.4 |
| Unfunded obligation through $2098^{\text {b }}$ | 22.6 | 3.3 | 1.2 |

${ }^{\text {a }}$ Present value of future cost less future non-interest income, reduced by the amount of trust fund asset reserves at the beginning of 2024. Expressed as a percentage of payroll and GDP for the period 2024 through the infinite horizon.
${ }^{\mathrm{b}}$ Present value of future cost less future non-interest income through 2098, reduced by the amount of trust fund reserves at the beginning of 2024. Expressed as a percentage of payroll and GDP for the period 2024 through 2098.
Notes:

1. The present values of future taxable payroll for 2024-98 and for 2024 through the infinite horizon are $\$ 681.8$ trillion and $\$ 1,391.5$ trillion, respectively.
2. The present values of GDP for 2024-98 and for 2024 through the infinite horizon are $\$ 1,944.1$ trillion and $\$ 4,403.2$ trillion, respectively. Present values of GDP shown in the Medicare Trustees Report differ slightly due to the use of discount rates that are specific to each program's trust fund holdings.

Last year, the Trustees projected that the infinite horizon unfunded obligation was $\$ 65.9$ trillion in present value discounted to January 1, 2023. If the assumptions, methods, and starting values had not changed, moving the valuation date forward by 1 year to January 1, 2024 would have discounted future values by 1 year less, thus increasing the measured unfunded obligation by about $\$ 1.5$ trillion, to $\$ 67.4$ trillion. The net effects of changes in assumptions, methods, law, and starting values decreased the infinite horizon unfunded obligation by $\$ 4.6$ trillion. This net decrease occurred for a variety of reasons, particularly changes in economic factors and the lower assumed ultimate disability incidence rate, which are partially offset by the lower assumed ultimate total fertility rate. See section IV.B. 6 for details regarding changes in law, data, methods, and assumptions.
Compared to last year's report, the unfunded obligation over the infinite horizon in this year's report decreased by 0.1 percentage point as a share of taxable payroll and remained the same as a share of GDP. The unfunded obligation over the 75 -year projection period decreased by 0.1 percentage point as a share of taxable payroll and remained the same as a share of GDP.

## a. Unfunded Obligations for Past, Current, and Future Participants

Table VI.F2 separates the components of the infinite horizon unfunded obligation (with the exception of General Fund reimbursements) among past, current, and future participants. The table does not separate past General Fund reimbursements among participants because there is no clear basis for attributing the reimbursements across generations.

Past participants are defined as those no longer alive as of the valuation date. Current participants are those age 15 and older as of 2024. Future participants are those under age 15 or not yet born.

The excess of the present value of cost for past and current participants over the present value of dedicated tax income for past and current participants produces an unfunded obligation for past and current participants of $\$ 50.5$ trillion. Table VI.F2 also shows an unfunded obligation of $\$ 49.8$ trillion for past and current participants, including past and future General Fund reimbursements. Future participants are scheduled to pay dedicated taxes of $\$ 13.0$ trillion less into the system than the cost of their scheduled benefits ( $\$ 140.5$ trillion of dedicated tax income as compared to $\$ 153.5$ trillion of cost). The unfunded obligation for all participants through the infinite horizon thus equals $\$ 62.8$ trillion.

Making Social Security solvent over the infinite horizon requires some combination of increased revenue or reduced benefits for current and future participants amounting to $\$ 62.8$ trillion in present value, 4.5 percent of future taxable payroll, or 1.4 percent of future GDP.

## Appendices

Table VI.F2.-Present Values Through the Infinite Horizon
for Various Categories of Program Participants, Based on Intermediate Assumptions [Present values as of January 1, 2024; dollar amounts in trillions]

|  | Present value | Expressed as a percentage of future payroll and GDP |  |
| :---: | :---: | :---: | :---: |
|  |  | Taxable payroll | GDP |
| Present value of past cost | \$79.7 | 5.7 | 1.8 |
| Less present value of past dedicated tax income | 81.7 | 5.9 | 1.9 |
| Plus present value of future cost for current participants | 99.7 | 7.2 | 2.3 |
| Less present value of future dedicated tax income for current participants | 47.1 | 3.4 | 1.1 |
| Equals unfunded obligation for past and current participants excluding General Fund reimbursements | 50.5 | 3.6 | 1.1 |
| Less present value of past General Fund reimbursements ${ }^{\text {a }}$. | . 7 | . 1 | b |
| Less present value of future General Fund reimbursements through the infinite horizon ${ }^{\text {a }}$ | c | d | b |
| Equals unfunded obligation for past and current participants including General Fund reimbursements | 49.8 | 3.6 | 1.1 |
| Plus present value of cost for future participants through the infinite horizon. | 153.5 | 11.0 | 3.5 |
| Less present value of dedicated tax income for future participants through the infinite horizon. | 140.5 | 10.1 | 3.2 |
| Equals unfunded obligation for all participants through the infinite horizon | 62.8 | 4.5 | 1.4 |

${ }^{\text {a }}$ Distribution of General Fund reimbursements among past, current, and future participants cannot be determined.
${ }^{\mathrm{b}}$ Less than 0.05 percent of GDP.
${ }^{\text {c }}$ Less than $\$ 50$ billion.
${ }^{\mathrm{d}}$ Less than 0.05 percent of taxable payroll.
Notes:

1. The present value of future taxable payroll for 2024 through the infinite horizon is $\$ 1,391.5$ trillion.
2. The present value of GDP for 2024 through the infinite horizon is $\$ 4,403.2$ trillion.
3. Components may not sum to totals because of rounding.

## G. ESTIMATES FOR OASDI AND HI, SEPARATE AND COMBINED

In this appendix, the Trustees present long-range actuarial estimates for the OASDI and Hospital Insurance (HI) programs both separately and on a combined basis. These estimates facilitate analysis of the adequacy of the income and asset reserves of these programs relative to their cost under current law. This appendix does not include estimates for the Supplementary Medical Insurance (SMI) program because adequate financing is guaranteed in the law and because the SMI program is not financed through a payroll tax. For more information on Medicare estimates, please see the 2024 Medicare Trustees Report.

The information in this appendix on combined operations, while significant, should not obscure the analysis of the financial status of the individual trust funds, which are legally separate and cannot be commingled. In addition, the factors which determine the costs of the OASI, DI, and HI programs differ substantially.

## 1. Estimates as a Percentage of Taxable Payroll

Comparing cost and income rates for the OASDI and HI programs as percentages of taxable payroll requires a note of caution. The taxable payrolls for the HI program are larger than those for the OASDI program because: (1) a larger maximum taxable amount was established for the HI program in 1991, with the maximum eliminated altogether for the HI program in 1994; (2) larger proportions of Federal, State, and local government employees are covered under the HI program; and (3) the earnings of railroad workers are included directly in the HI taxable payroll but are not included in the OASDI taxable payroll. (Railroad worker contributions for the equivalent of OASDI benefits are accounted for in a net interchange that occurs annually between the OASDI and Railroad Retirement programs.) As a result, the HI taxable payroll is 25 percent larger than the OASDI taxable payroll on average over the long-range period.

As with the OASI and DI Trust Funds, income to the HI Trust Fund comes primarily from contributions paid by employees, employers, and selfemployed persons. Table VI.G1 shows the OASDI and HI contribution rates that are authorized in the Federal Insurance Contributions Act.

## Appendices

Table VI.G1.—Payroll Tax Contribution Rates for the OASDI and HI Programs
[In percent]

| Calendar years | Employees and employers, combined ${ }^{\mathrm{a}}$ |  | Employees only | Self employed ${ }^{\text {b }}$ |  |  |

| 1986-87 ${ }^{\text {f }}$ | 11.40 | 2.90 | - | 11.40 | 2.90 | - |
| 1988-89 ${ }^{\text {f }}$. | 12.12 | 2.90 | - | 12.12 | 2.90 | - |
| 1990-2010g. . | 12.40 | 2.90 | - | 12.40 | 2.90 | - |
| 2011-2012 ${ }^{\text {h }}$. | 10.40 | 2.90 | - | 10.40 | 2.90 | - |
| 2013 and later. . | 12.40 | 2.90 | 0.90 | 12.40 | 2.90 | 0.90 |

${ }^{\text {a }}$ Except as noted below, the combined employee/employer rate is divided equally between employees and employers.
${ }^{\mathrm{b}}$ Beginning in 1990, self-employed persons receive a deduction, for purposes of computing their net earnings, equal to half of the combined OASDI and HI contributions that would be payable without regard to the contribution and benefit base. The OASDI contribution rate then applies to net earnings after this deduction, but subject to the OASDI base.
${ }^{\mathrm{c}}$ The payroll tax on earnings for the OASDI program applies to annual earnings up to a contribution and benefit base indexed to the average wage level. The base is $\$ 168,600$ for 2024.
${ }^{\text {d }}$ Prior to 1994, the payroll tax on earnings for the HI program applied to annual earnings up to a contribution base. The HI contribution base was eliminated beginning in 1994.
${ }^{\mathrm{e}}$ Starting with Federal personal income tax returns for tax year 2013, earned income exceeding $\$ 200,000$ for individual filers and $\$ 250,000$ for married couples filing jointly is subject to an additional HI tax of 0.9 percent. These income limits are not indexed after 2013.
${ }^{\mathrm{f}}$ In 1984 only, employees received an immediate credit of 0.3 percent of taxable wages against their OASDI payroll tax contributions. The self-employed received similar credits of 2.7 percent, 2.3 percent, and 2.0 percent against their combined OASDI and Hospital Insurance (HI) contributions on net earnings from self-employment in 1984, 1985, and 1986-89, respectively. The General Fund of the Treasury reimbursed the trust funds for these credits.
g Public Law 111-147 exempted most employers from paying the employer share of OASDI payroll tax on wages paid during the period March 19, 2010 through December 31, 2010 to certain qualified individuals hired after February 3, 2010. The General Fund of the Treasury reimbursed the trust funds for the payroll tax revenue forgone under this law.
${ }^{\text {h }}$ Public Law 111-312, Public Law 112-78, and Public Law 112-96 reduced the OASDI payroll tax rate for 2011 and 2012 by 2 percentage points for employees and for self-employed workers. The General Fund of the Treasury reimbursed the trust funds for the payroll tax revenue forgone under these laws.

Table VI.G2 shows the Trustees' estimates of annual income rates and cost rates for the OASDI program and the HI program under the intermediate, low-cost, and high-cost sets of assumptions described earlier in this report. The income rates reflect the payroll tax rates shown in table VI.G1, revenue from taxation of scheduled OASDI benefits for both the OASDI and HI

Trust Funds, and any reimbursements from the General Fund of the Treasury. For the HI program, the income rates also reflect: (1) the additional 0.9-percent tax on employees for relatively high earnings and the portion of total payroll to which the 0.9 -percent rate applies, (2) premium revenues, and (3) monies from fraud and abuse control activities. Annual income and cost rates indicate the cash-flow operation of the programs. Income rates exclude interest earned on trust fund asset reserves. Table VI.G2 also shows annual balances, which are the differences between annual income rates and cost rates.

The Trustees project that the OASDI and HI cost rates will rise generally above current levels under the intermediate and high-cost sets of assumptions. The greatest increase occurs from 2024 to about 2040 under the intermediate and high-cost assumptions for OASDI and the intermediate assumptions for HI , and from 2024 to 2060 under the high-cost assumptions for HI. Under the intermediate assumptions, the OASDI cost rate increases by 23 percent from its current level by 2098 , while under the high-cost assumptions, the cost rate increases by 87 percent by 2098 . For HI, cost rates increase by 37 percent and 190 percent from 2024 to 2098 under the intermediate and high-cost assumptions, respectively. Under the low-cost assumptions, the OASDI and HI cost rates decrease from 2024 to 2098 by 13 percent and 34 percent, respectively.

The Trustees project annual deficits for every year of the projection period under the intermediate and high-cost assumptions for the OASDI program, and annual deficits for 2025 through 2098 under the high-cost assumptions for the HI program. Under the intermediate assumptions, HI annual balances are projected to be positive for 2024 through 2028 and negative and decreasing for 2029 through 2044. Thereafter, HI annual balances slowly increase (become less negative) and become positive in 2098. Under the low-cost assumptions, OASDI annual balances are negative through 2083, and are positive and mostly increasing thereafter, reaching 0.59 percent of payroll for 2098. HI annual balances as a percent of payroll are positive and mostly increasing throughout the projection period under the low-cost assumptions, reaching 2.31 percent of HI taxable payroll by 2098.

| 2100 | 14.12 | 28.34 | -14.22 | 4.82 | 10.65 | -5.84 |

${ }^{\text {a }}$ The taxable payroll for HI is significantly larger than the taxable payroll for OASDI because the HI taxable maximum amount was eliminated beginning in 1994, and because HI covers all Federal civilian employees, all State and local government employees hired after April 1, 1986, and railroad employees.
${ }^{\mathrm{b}}$ OASDI benefit payments which were scheduled to be paid on January 3 for some past and future years were actually paid on December 31 as required by the statutory provision for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. For comparability with the values for historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment each year.
${ }^{\mathrm{c}}$ Between 0 and 0.005 percent of taxable payroll.
Notes:

1. The income rate excludes interest income.
2. The Trustees show income and cost estimates generally on a cash basis for the OASDI program and on an incurred basis for the HI program.
3. Components may not sum to totals because of rounding.

Table VI.G3 shows summarized values over the 25 -year, 50 -year, and 75 -year valuation periods. For each of those periods, the summarized income rates include beginning trust fund asset reserves, and the summarized cost rates include the cost of accumulating an ending fund reserve equal to 100 percent of annual cost at the end of the period.

## Appendices

Table VI.G3.-Summarized OASDI and HI Income Rates and Cost Rates for Valuation Periods, ${ }^{\text {a }}$ Calendar Years 2024-2098
[As a percentage of taxable payroll ${ }^{\text {b }}$ ]

|  | OASDI |  |  | HI |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Valuation period | Income rate | Cost rate ${ }^{\mathrm{c}}$ | Actuarial balance | Income rate | Cost rate | Actuarial balance |

$\left.\begin{array}{cccccc}\hline \begin{array}{c}\text { Intermediate: } \\ \text { 25-year: } \\ \text { 2024-48 } \ldots \ldots\end{array} & 14.30 & 16.57 & -2.28 & 3.80 & 4.25\end{array}\right)-0.45$
${ }^{\text {a }}$ Income rates include beginning trust fund asset reserves and cost rates include the cost of reaching an ending target trust fund equal to 100 percent of annual cost at the end of the period.
${ }^{\mathrm{b}}$ The taxable payroll for HI is significantly larger than the taxable payroll for OASDI because the HI taxable maximum amount was eliminated beginning 1994, and because HI covers all Federal civilian employees, all State and local government employees hired after April 1, 1986, and railroad employees.
${ }^{\mathrm{c}}$ OASDI benefit payments which were scheduled to be paid on January 3 for some past and future years were actually paid on December 31 as required by the statutory provision for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. For comparability with the values for historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment each year.
Note: Components may not sum to totals because of rounding.
The Trustees project that the OASDI and HI programs will each experience large actuarial deficits for the 25 -year, 50 -year, and 75 -year valuation periods under the high-cost assumptions. Actuarial deficits under the intermediate assumptions are smaller than those for the high-cost assumptions for all three valuation periods. Under the low-cost assumptions, the OASDI program has relatively small actuarial deficits for all three valuation periods, while the HI program has positive actuarial balances for all three valuation periods.

## 2. Estimates as a Percentage of Gross Domestic Product

This section presents long-range projections of the operations of the combined Old-Age and Survivors Insurance and Disability Insurance (OASI and DI) Trust Funds and of the Hospital Insurance (HI) Trust Fund, expressed as a percentage of gross domestic product (GDP). While expressing fund operations as a percentage of taxable payroll is a very useful approach for assessing the financial status of the programs (see section IV.B.1), expressing them as a percentage of the total value of goods and services produced in the United States provides an additional perspective.
Table VI.G4 shows non-interest income, total cost, and the resulting balance of the combined OASI and DI Trust Funds, of the HI Trust Fund, and of the combined OASI, DI, and HI Trust Funds, expressed as percentages of GDP on the basis of each of the three alternative sets of assumptions. Table VI.G4 also contains estimates of GDP. For OASDI, non-interest income consists of payroll tax contributions, proceeds from taxation of scheduled OASDI benefits, and any reimbursements from the General Fund of the Treasury. Cost consists of scheduled benefits, administrative expenses, financial interchange with the Railroad Retirement program, and payments for vocational rehabilitation services for disabled beneficiaries. For HI, non-interest income consists of payroll tax contributions (including contributions from railroad employment), up to an additional 0.9 percent tax on earned income for relatively high earners, proceeds from taxation of scheduled OASDI benefits, premium revenues, monies from fraud and abuse control activities, and any reimbursements from the General Fund of the Treasury. Cost consists of outlays (benefits and administrative expenses) for beneficiaries. The Trustees show income and cost estimates generally on a cash basis for the OASDI program ${ }^{1}$ and on an incurred basis for the HI program.
The Trustees project the OASDI annual balance (non-interest income less cost) as a percentage of GDP to be negative throughout the projection period under the intermediate and high-cost assumptions. Under the low-cost assumptions, the OASDI annual deficit as a percentage of GDP decreases from 2024 through 2052, slightly increases through 2073, and then decreases through 2083 before annual balances become positive for years 2084 and later. Under the intermediate assumptions, the OASDI annual deficits as a percentage of GDP increase from 2024 through 2079, and mostly decrease

[^50]
## Appendices

thereafter. Under the high-cost assumptions, OASDI annual deficits increase relatively rapidly through 2090, and then slightly decrease through the end of the projection period.

The Trustees project that the HI annual balance as a percentage of GDP will be positive and mostly increasing throughout the projection period, under the low-cost assumptions. Under the intermediate assumptions, HI annual balances are positive and increasing for years 2024 through 2026. After 2026, the HI annual balance decreases and becomes negative in 2029. After 2029, annual deficits increase through 2044, and then decline thereafter, with annual deficits changing to a small positive annual balance in 2098. Under the high-cost assumptions, the HI annual balance is positive in 2024 and then negative for 2025 through 2098, with annual deficits reaching a peak in 2072 and declining thereafter.

The combined OASDI and HI annual balance as a percentage of GDP is negative throughout the projection period under both the intermediate and highcost assumptions. Under the low-cost assumptions, the combined OASDI and HI annual balance is negative through 2032, and then positive and mostly rising thereafter. Under the intermediate assumptions, the combined OASDI and HI annual deficits increase through 2078 and then decline thereafter, reaching 1.56 percent of GDP by 2098 . Under the high-cost assumptions, combined annual deficits rise to a peak of 6.65 percent in 2085 and decrease thereafter.

By 2098, the combined OASDI and HI annual balances as percentages of GDP range from a positive annual balance of 1.26 percent for the low-cost assumptions to an annual deficit of 6.44 percent for the high-cost assumptions. Annual balances differ by a much smaller amount for the tenth projection year, 2033, ranging from a positive annual balance of 0.01 percent for the low-cost assumptions to an annual deficit of 2.17 percent for the highcost assumptions.

The summarized long-range (75-year) actuarial balance as a percentage of GDP for the combined OASDI and HI programs varies among the three alternatives by a relatively large amount, from a positive actuarial balance of 0.65 percent under the low-cost assumptions to an actuarial deficit of 4.42 percent under the high-cost assumptions. The 25 -year summarized actuarial balance varies by a smaller amount, from a positive actuarial balance of 0.19 percent of GDP to an actuarial deficit of 2.52 percent. Summarized rates are calculated on a present-value basis. They include the trust fund reserve balances on January 1, 2024 and the cost of reaching a target trust fund level equal to 100 percent of the following year's annual cost at the end of the period. (See section IV.B. 4 for further explanation.)

${ }^{\text {a }}$ Income for individual years excludes interest on the trust funds. Interest is implicit in all summarized values.
${ }^{\mathrm{b}}$ OASDI benefit payments which were scheduled to be paid on January 3 for some past and future years were actually paid on December 31 as required by the statutory provision for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. For comparability with the values for historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment each year.
${ }^{\mathrm{c}}$ Between 0 and 0.005 percent of GDP.
${ }^{\mathrm{d}}$ Summarized rates are calculated on a present-value basis. They include the value of the trust funds on January 1, 2024 and the cost of reaching a target trust fund level equal to 100 percent of annual cost at the end of the period.

Notes:

1. The Trustees show income and cost estimates generally on a cash basis for the OASDI program and on an incurred basis for the HI program.
2. Components may not sum to totals because of rounding.

Table VI.G5 displays annual ratios of OASDI taxable payroll to GDP. These ratios facilitate comparisons of trust fund operations expressed as percentages of taxable payroll and those expressed as percentages of GDP. HI taxable payroll is 25 percent larger than the OASDI taxable payroll on average over the long-range period; see section 1 of this appendix for a detailed description of the difference. For each year, the cost as a percentage of GDP is equal to the cost as a percentage of taxable payroll multiplied by the ratio of taxable payroll to GDP.

Table VI.G5.-Ratio of OASDI Taxable Payroll to GDP, Calendar Years 2024-2100

| Calendar year | Intermediate | Low-cost | High-cost |

Projections of GDP reflect projected increases in U.S. employment, labor productivity, average hours worked, and the GDP price index (GDP deflator). Projections of taxable payroll reflect the components of growth in GDP along with assumed changes in the ratio of total labor compensation to GDP, the ratio of earnings to total labor compensation, the ratio of OASDI covered earnings to total earnings, and the ratio of taxable to total covered earnings.

Over the long-range period, the ratio of OASDI taxable payroll to GDP is projected to decline mostly due to a projected decline in the ratio of wages and salaries to employee compensation. Over the last six complete economic cycles, the ratio of wages and salaries to employee compensation declined at an average annual rate of 0.17 percent. Over the 65 -year period ending in 2098, the ratio of wages and salaries to employee compensation is projected to remain the same for the low-cost assumptions and decline at an average annual rate of 0.10 and 0.20 percent for the intermediate and high-cost assumptions, respectively.

## Appendices

## 3. Estimates in Dollars

This section presents long-range projections, in dollars, of the operations of the combined OASI and DI Trust Funds and in some cases the HI Trust Fund. Comparing current dollar values over long periods of time is difficult because of the effect of inflation. In order to compare dollar values in a meaningful way, table VI.G6 provides several economic series or indices which can be used to adjust current dollars for changes in prices, wages, or other aspects of economic growth during the projection period. Any series of values can be adjusted by dividing the value for each year by the corresponding index value for the year.
One of the most common forms of standardization is price indexing, which uses some measure of change in the prices of consumer goods. The Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W, hereafter referred to as CPI), published by the Bureau of Labor Statistics, Department of Labor, is one such price index. Consistent with the law, the Social Security Administration (SSA) uses this index to determine the annual cost-of-living increases for OASDI monthly benefits. The ultimate annual rate of increase in the CPI is assumed to be $3.0,2.4$, and 1.8 percent for the low-cost, intermediate, and high-cost sets of assumptions, respectively. Table VI.G7 provides CPI-indexed dollar values (those adjusted using the CPI in table VI.G6), which indicate the relative purchasing power of the values over time.

Wage indexing is another type of standardization. It combines the effects of price inflation and real wage growth. The wage index presented here is the national average wage index, as defined in section $209(\mathrm{k})(1)$ of the Social Security Act. SSA uses this index to annually adjust the contribution and benefit base and other earnings-related program amounts. The average wage is assumed to grow by an average rate of $4.8,3.6$, and 2.3 percent under the low-cost, intermediate, and high-cost assumptions, respectively, between 2033 and 2098. Wage-indexed values indicate the level of a series of values relative to the changing standard of living of workers over time.

The taxable payroll series is used as an index to adjust for the effects of changes in the number of workers and changes in the proportion of earnings that are taxable, as well as for the effects of price inflation and real wage growth. The OASDI taxable payroll consists of all earnings subject to OASDI taxation, with an adjustment for the lower effective tax rate on multi-ple-employer excess wages. A series of values, divided by the taxable payroll, indicates the percentage of payroll that each value represents, and thus
the extent to which the series of values increases or decreases as a percent of payroll over time.
The GDP series is used as an index to adjust for the growth in the aggregate amount of goods and services produced in the United States. Values adjusted by GDP (see section 2 of this appendix) indicate their relative share of the total output of the economy. No direct assumption is made about growth in taxable payroll or GDP. These series reflect the basic demographic and economic assumptions, as discussed in sections V.A and V.B, respectively.

Discounting at the rate of interest is another way of standardizing current dollars. The compound new-issue interest factor shown in table VI.G6 increases each year by the assumed effective annual nominal yield for special public-debt obligations issuable to the trust funds in the 12 months of the prior year. The compound effective trust-fund interest factor shown in table VI.G6 uses the effective annual yield on all currently-held securities in the combined OASI and DI Trust Funds. The reciprocal of the compound effective trust-fund interest factor approximates the cumulative discount factor used to convert nominal dollar values to present values as of the start of the valuation period in order to create summarized values for this report.

${ }^{\text {a }}$ CPI-W indexed to calendar year 2024.
${ }^{\mathrm{b}}$ Total earnings subject to OASDI contribution rates, adjusted to reflect the lower effective contribution rates (compared to the combined employee-employer rate) that apply to multiple-employer "excess wages."
${ }^{c}$ For each alternative, incorporates the average of the assumed annual yield for special public-debt obligations issuable to the trust funds in the 12 months of the prior year.
${ }^{\mathrm{d}}$ For each alternative, incorporates the annual effective yield for all outstanding special public-debt obligations held by the trust fund, with a half-year's interest effect in each row. The effective yield for a period equals total interest earned during the period divided by the total exposure to interest on asset reserves and all income and cost items during the period. The reciprocals of the factors approximate the discounting/ accumulation factors that are used to calculate summarized rates and balances in this report

Table VI.G7 shows the operations of the combined OASI and DI Trust Funds in CPI-indexed 2024 dollars - that is, adjusted by the CPI indexing series as discussed above. The following items are presented in the table: (1) noninterest income, (2) interest income, (3) total income, (4) cost, and (5) asset reserves at the end of the year. Non-interest income consists of payroll tax contributions, income from taxation of scheduled OASDI benefits, and any reimbursements from the General Fund of the Treasury. Cost consists of scheduled benefits, administrative expenses, financial interchange with the Railroad Retirement program, and payments for vocational rehabilitation services for disabled beneficiaries. Table VI.G7 shows trust fund operations under the intermediate, low-cost, and high-cost sets of assumptions.

## Appendices

Table VI.G7.-Operations of the Combined OASI and DI Trust Funds, in CPI-Indexed 2024 Dollars, ${ }^{\text {a }}$ Calendar Years 2024-2100 [In billions]

| Calendar year | Non-interest <br> income | Interest <br> income | Total <br> income |  |  |
| :---: | ---: | ---: | ---: | ---: | ---: |
| Cost $^{\text {b }}$ |  |  |  |  |  | | Asset |
| ---: |
| reserves at |
| entermediate: year |

${ }^{\text {a }}$ CPI-indexed 2024 dollars equal current dollars adjusted by the CPI indexing series in table VI.G6.
${ }^{\mathrm{b}}$ Benefit payments which were scheduled to be paid on January 3 for some past and future years were actually paid on December 31 as required by the statutory provision for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. For comparability with the values for historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment each year.
${ }^{\text {c }}$ The combined OASI and DI Trust Funds become depleted in 2035 under the intermediate assumptions and in 2032 under the high-cost assumptions, so estimates for later years are not shown.
${ }^{\text {d }}$ The combined OASI and DI Trust Funds become depleted in 2080 under the low-cost assumptions. However, the trust funds would have sufficient income by the end of 2086 to permit full payment of scheduled benefits thereafter and also to pay in arrears the temporary shortfalls between 2080 and 2086. Combined asset reserves become positive again by the beginning of 2087 and remain positive through the remainder of the projection period. Estimates are not shown for years in which asset reserves are negative.

Note: Components may not sum to totals because of rounding.

Figure VI.G1 compares annual cost with annual total income and annual non-interest income. The figure shows only the OASDI program under intermediate assumptions, and presents values in CPI-indexed 2024 dollars, consistent with table VI.G7. The difference between the income values for each year is equal to the trust fund interest earnings. The figure illustrates that, under intermediate assumptions, annual cost exceeds both total income and non-interest income for 2024 through 2035, when trust fund reserves become depleted. Estimates after reserve depletion are not shown. For 2024 through 2034 (the year preceding the year of trust fund reserve depletion), annual cost is covered by drawing down combined trust fund reserves.

Figure VI.G1.-Estimated OASDI Income and Cost in CPI-Indexed 2024 Dollars, Based on Intermediate Assumptions
[In billions]

Table VI.G8 presents the operations of the combined OASI and DI Trust Funds in current, or nominal, dollars-that is, in dollars unadjusted for inflation. The following items are presented in the table: (1) non-interest income, (2) interest income, (3) total income, (4) cost, and (5) asset reserves at the end of the year. These estimates are presented using the intermediate, lowcost, and high-cost sets of demographic and economic assumptions to facilitate independent analysis.

## Appendices

Table VI.G8.-Operations of the Combined OASI and DI Trust Funds, in Current Dollars, Calendar Years 2024-2100 [In billions]

${ }^{\text {a }}$ Benefit payments which were scheduled to be paid on January 3 for some past and future years were actually paid on December 31 as required by the statutory provision for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. For comparability with the values for historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment each year.
${ }^{\mathrm{b}}$ The combined OASI and DI Trust Funds become depleted in 2035 under the intermediate assumptions and in 2032 under the high-cost assumptions, so estimates for later years are not shown.
${ }^{\text {c }}$ The combined OASI and DI Trust Funds become depleted in 2080 under the low-cost assumptions. However, the trust funds would have sufficient income by the end of 2086 to permit full payment of scheduled benefits thereafter and also to pay in arrears the temporary shortfalls between 2080 and 2086. Combined asset reserves become positive again by the beginning of 2087 and remain positive through the remainder of the projection period. Estimates are not shown for years in which asset reserves are negative.

Note: Components may not sum to totals because of rounding.

Table VI.G9 presents values in CPI-indexed 2024 dollars-that is, adjusted by the CPI indexing series discussed at the beginning of this section. This table contains the annual non-interest income and cost of the combined OASI and DI Trust Funds, of the HI Trust Fund, and of the combined OASI, DI, and HI Trust Funds, based on the intermediate, low-cost, and high-cost sets of assumptions. For OASDI, non-interest income consists of payroll tax contributions, proceeds from taxation of scheduled OASDI benefits, and any reimbursements from the General Fund of the Treasury. Cost consists of scheduled benefits, administrative expenses, financial interchange with the Railroad Retirement program, and payments for vocational rehabilitation services for disabled beneficiaries. For HI, non-interest income consists of payroll tax contributions (including contributions from railroad employment), up to an additional 0.9 percent tax on earned income for relatively high earners, proceeds from the taxation of scheduled OASDI benefits, premium revenues, monies from fraud and abuse control activities, and any reimbursements from the General Fund of the Treasury. Total cost consists of scheduled benefits and administrative expenses. The Trustees show income and cost estimates generally on a cash basis for the OASDI program ${ }^{1}$ and on an incurred basis for the HI program. Table VI.G9 also shows the annual balance, which equals the difference between non-interest income and cost.

${ }^{\text {a }}$ CPI-indexed 2024 dollars equal current dollars adjusted by the CPI indexing series in table VI.G6.
${ }^{\mathrm{b}}$ OASDI benefit payments which were scheduled to be paid on January 3 for some past and future years were actually paid on December 31 as required by the statutory provision for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. For comparability with the values for historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment each year.
${ }^{c}$ Between $\$ 0$ and $\$ 500$ million.
Note: Components may not sum to totals because of rounding.
Table VI.G10 shows values in current, or nominal, dollars-that is, in dollars unadjusted for inflation. This table presents the annual non-interest income, cost, and balance of the combined OASI and DI Trust Funds, of the HI Trust Fund, and of the combined OASI, DI, and HI Trust Funds, based on the intermediate, low-cost, and high-cost sets of assumptions.

${ }^{\text {a }}$ OASDI benefit payments which were scheduled to be paid on January 3 for some past and future years were actually paid on December 31 as required by the statutory provision for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. For comparability with the values for historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment each year.
${ }^{\mathrm{b}}$ Between $\$ 0$ and $\$ 500$ million.
Note: Components may not sum to totals because of rounding.

## Appendices

## H. ANALYSIS OF BENEFIT PAYMENTS FROM THE OASI TRUST FUND WITH RESPECT TO DISABLED BENEFICIARIES (Required by section 201(c) of the Social Security Act)

Effective January 1957, the OASI Trust Fund pays monthly benefits to disabled children aged 18 and over of retired and deceased workers if the disability began before age 18 . The age by which disability must have begun was later changed to age 22. Effective February 1968, the OASI Trust Fund pays reduced monthly benefits to disabled widows and widowers at ages 50 and over. Effective January 1991, the requirements for the disability of the widow or widower were made less restrictive.

At the end of 2023, the OASI Trust Fund was providing monthly benefit payments to about $1,126,000$ people because of their disabilities or the disabilities of children. This total includes approximately 20,000 mothers and fathers (wives or husbands under normal retirement age of retired-worker beneficiaries and widows or widowers of deceased insured workers) who met all other qualifying requirements and were receiving unreduced benefits solely because they had disabled-child beneficiaries (or disabled children aged 16 or 17) in their care. In calendar year 2023, the OASI Trust Fund paid a total of $\$ 14,587$ million to the people described above. Table VI.H1 shows OASI scheduled benefits for disability for selected calendar years during 1960 through 2023 and estimates for 2024 through 2033 based on the intermediate set of assumptions.

| 2033 | 1,274 | 1,215 | 59 | 22,476 | 21,511 | 937 |

${ }^{\text {a }}$ Beginning in 1966, includes payments for vocational rehabilitation services.
${ }^{\text {b }}$ Amounts for 2020 and 2021 are adjusted to include in 2021 operations those benefit payments regularly scheduled in the law to be paid on January 3, 2021, which were actually paid on December 31, 2020 as required by the statutory provision for early benefit payments when the normal delivery date is on a weekend or holiday. Such shifts in payments across calendar years have occurred in the past, including in 2016, and will occur periodically in the future whenever January 3rd falls on a Sunday. In order to provide a consistent perspective on trust fund operations over time, all trust fund operations in each year reflect the 12 months of benefits that are regularly scheduled for payment in that year.
${ }^{c}$ Also includes certain mothers and fathers (see text).
${ }^{\text {d }}$ In 1984 and later years, includes only disabled widows and widowers aged 50-59, because disabled widows and widowers age 60 and older are eligible for the same benefit as a nondisabled aged widow or widower. Therefore, they are not receiving benefits solely because of a disability.
${ }^{\mathrm{e}}$ In 1983 and prior years, includes the offsetting effect of lower benefits payable to disabled widows and widowers who continued to receive benefits after attaining age 60 ( 62 , for disabled widowers prior to 1973), compared to the higher nondisabled widow's and widower's benefits that would otherwise be payable. In 1984 and later years, includes only scheduled benefits to disabled widows and widowers aged 50-59 (see footnote d).
Note: Components may not sum to totals because of rounding.

## Appendices

Under the intermediate assumptions, estimated total scheduled benefits paid from the OASI Trust Fund with respect to disabled beneficiaries will increase from $\$ 15,268$ million in calendar year 2024 to $\$ 22,476$ million in calendar year 2033.

In calendar year 2023, benefit payments (including payments for vocational rehabilitation services) with respect to disabled persons from the OASI Trust Fund and from the DI Trust Fund (including payments from the DI fund to all children and spouses of disabled-worker beneficiaries) totaled $\$ 166,533$ million. Of this amount, $\$ 14,587$ million, or 8.8 percent, represented payments from the OASI Trust Fund. Table VI.H2 contains these and similar figures for selected calendar years during 1960 through 2023 and estimates for calendar years 2024 through 2033.

| 2021 | 152,538 | 140,085 | 12,453 | 8.2 |
| 2022 | 156,861 | 143,595 | 13,266 | 8.5 |
| 2023 | 166,533 | 151,946 | 14,587 | 8.8 |
| Estimates under the intermediate assumptions: |  |  |  |  |
| 2024 | 170,494 | 155,227 | 15,268 | 9.0 |
| 2025 | 179,949 | 163,979 | 15,970 | 8.9 |
| 2026 | 191,590 | 174,946 | 16,643 | 8.7 |
| 2027 | 201,912 | 184,497 | 17,415 | 8.6 |
| 2028 | 206,956 | 188,766 | 18,190 | 8.8 |
| 2029 | 209,036 | 190,049 | 18,987 | 9.1 |
| 2030 | 214,626 | 194,835 | 19,790 | 9.2 |
| 2031 | 221,697 | 201,070 | 20,627 | 9.3 |
| 2032 | 229,833 | 208,313 | 21,520 | 9.4 |
| 2033 ......... | 239,387 | 216,912 | 22,476 | 9.4 |

${ }^{\text {a }}$ Amounts for 2020 and 2021 are adjusted to include in 2021 operations those benefit payments regularly scheduled in the law to be paid on January 3, 2021, which were actually paid on December 31, 2020 as required by the statutory provision for early benefit payments when the normal delivery date is on a weekend or holiday. Such shifts in payments across calendar years have occurred in the past, including in 2016, and will occur periodically in the future whenever January 3rd falls on a Sunday. In order to provide a consistent perspective on trust fund operations over time, all trust fund operations in each year reflect the 12 months of benefits that are regularly scheduled for payment in that year.
${ }^{\mathrm{b}}$ Beginning in 1966, includes payments for vocational rehabilitation services.
${ }^{\mathrm{c}}$ Scheduled benefits for disabled workers and their children and spouses.
${ }^{\mathrm{d}}$ Scheduled benefits for disabled children aged 18 and over, for certain mothers and fathers (see text), and for disabled widows and widowers (see footnote e, table VI.H1).

Note: Components may not sum to totals because of rounding.

## I. GLOSSARY

Actuarial balance. The difference between the summarized income rate and the summarized cost rate as a percentage of taxable payroll over a given valuation period.
Actuarial deficit. A negative actuarial balance.
Administrative expenses. Expenses incurred by the Social Security Administration and the Department of the Treasury in administering the OASDI program and the provisions of the Internal Revenue Code relating to the collection of contributions. Such administrative expenses are paid from the OASI and DI Trust Funds.
Advance tax transfers. Amounts representing the estimated total OASDI tax contributions for a given month. From May 1983 through November 1990, such amounts were credited to the OASI and DI Trust Funds at the beginning of each month. The trust funds reimbursed the General Fund of the Treasury for the associated loss of interest. Advance tax transfers are no longer made unless needed in order to pay benefits.
Alternatives I, II, or III. See "Assumptions."
Annual balance. The difference between the income rate and the cost rate for a given year.
Asset reserves. See "Trust fund reserves".
Assumptions. Values related to future trends in key factors that affect the trust funds. Demographic assumptions include fertility, mortality, net immigration, marriage, and divorce. Economic assumptions include unemployment rates, average earnings, inflation, interest rates, and productivity. Program-specific assumptions include retirement patterns, and disability incidence and termination rates. This report presents three sets of demographic, economic, and program-specific assumptions:

- Alternative II is the intermediate set of assumptions, and represents the Trustees' best estimates of likely future demographic, economic, and program-specific conditions.
- Alternative I is a low-cost set of assumptions-it assumes relatively rapid economic growth, high inflation, and favorable (from the standpoint of program financing) demographic and program-specific conditions.
- Alternative III is a high-cost set of assumptions-it assumes relatively slow economic growth, low inflation, and unfavorable (from the standpoint of program financing) demographic and program-specific conditions.

See tables V.A2, V.B1, and V.B2.
Automatic cost-of-living benefit increase. The annual increase in benefits, effective for December, reflecting the increase, if any, in the cost of living. A
benefit increase is applicable only after a beneficiary becomes eligible for benefits. In general, the benefit increase equals the percentage increase in the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) measured from the third quarter of the last year for which there was an increase to the third quarter of the current year. If there is no increase in the CPI-W, there is no cost-of-living benefit increase. See table V.C1.
Auxiliary benefits. Monthly benefits payable to a spouse or child of a retired or disabled worker, or to a survivor of a deceased worker.
Average indexed monthly earnings-AIME. The measure of lifetime earnings used in determining the primary insurance amount (PIA) for most workers who attain age 62, become disabled, or die after 1978. A worker's actual past earnings are adjusted by changes in the average wage index, in order to bring them up to their approximately equivalent value at the time of retirement or other eligibility for benefits.
Average wage index-AWI. A series that generally increases with the average amount of total wages per worker with any wages for each year after 1950, including wages in noncovered employment and wages in covered employment in excess of the OASDI contribution and benefit base. (See Title 20, Chapter III, section 404.211(c) of the Code of Federal Regulations for a more precise definition.) The average wage index is used to index the taxable earnings of most workers first becoming eligible for benefits in 1979 or later, and for automatic adjustments in the contribution and benefit base, bend points, earnings test exempt amounts, and other wage-indexed amounts. See tables V.C1 and VI.G6.
Award. An administrative determination that an individual is entitled to receive a specified type of OASDI benefit. Awards can represent not only new entrants to the benefit rolls but also persons already on the rolls who become entitled to a different type of benefit. Awards usually result in the immediate payment of benefits, although payments may be deferred or withheld depending on the individual's particular circumstances.
Baby boom. The period from the end of World War II (1946) through 1965 marked by unusually high birth rates.
Bend points. The dollar amounts defining the AIME or PIA brackets in the benefit formulas. For the bend points for years 1979 and later, see table V.C2.
Beneficiary. A person who has been awarded benefits on the basis of his or her own or another's earnings record. The benefits may be either in currentpayment status or withheld.
Benefit award. See "Award."
Benefit conversion. See "Disability conversion."

## Appendices

Benefit payments. The amounts disbursed for OASI and DI benefits by the Department of the Treasury.
Benefit termination. See "Termination."
Best estimate assumptions. See "Assumptions."
Board of Trustees. A Board established by the Social Security Act to oversee the financial operations of the Federal Old-Age and Survivors Insurance Trust Fund and the Federal Disability Insurance Trust Fund. The Board is composed of six members. Four members serve by virtue of their positions in the Federal Government: the Secretary of the Treasury, who is the Managing Trustee; the Secretary of Labor; the Secretary of Health and Human Services; and the Commissioner of Social Security. The President appoints and the Senate confirms the other two members to serve as public representatives. Also referred to as the "Board" or the "Trustees."
Cash flow. Actual or projected revenue (other than interest paid to the trust funds) and costs reflecting the levels of payroll tax contribution rates and benefits scheduled in the law. Net cash flow is the difference between noninterest income and cost.
Consumer Price Index-CPI. An official measure of inflation in consumer prices. In this report, CPI refers to the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W). The Bureau of Labor Statistics, Department of Labor, publishes historical values for the CPI-W.
Contribution and benefit base. Annual dollar amount above which earnings in employment covered under the OASDI program are neither taxable nor creditable for benefit-computation purposes. (Also referred to as maximum contribution and benefit base, annual creditable maximum, taxable maximum, and maximum taxable.) See tables V.C1 and V.C6. See "Hospital Insurance (HI) contribution base."
Contributions. See "Payroll tax contributions."
Conversion. See "Disability conversion."
Cost. The cost shown for a year includes benefits scheduled for payment in the year (without regard to the ability to make the payments in full), administrative expenses, financial interchange with the Railroad Retirement program, and payments for vocational rehabilitation services for disabled beneficiaries.
Cost-of-living adjustment. See "Automatic cost-of-living benefit increase."
Cost rate. The cost rate for a year is the ratio of the cost of the program to the taxable payroll for the year.
Covered earnings. Wages or earnings from self-employment covered by the OASDI program.

Covered employment. All employment for which earnings are creditable for Social Security purposes. The program covers almost all employment. Some exceptions are:

- State and local government employees whose employer has not elected to be covered under Social Security and who are participating in an employer-provided pension plan.
- Current Federal civilian workers hired before 1984 who have not elected to be covered.
- Self-employed workers earning less than $\$ 400$ in a calendar year.

Covered worker. A person who has earnings creditable for Social Security purposes based on services for wages in covered employment or income from covered self-employment.
CPI-indexed dollars. Amounts adjusted by the CPI to the value of the dollar in a particular year.
Creditable earnings. Wages or self-employment earnings posted to a worker's earnings record. Such earnings determine eligibility for benefits and the amount of benefits on that worker's record. The contribution and benefit base is the maximum amount of creditable earnings for each worker in a calendar year.
Current-cost financing. See "Pay-as-you-go financing."
Current dollars. Amounts expressed in nominal dollars with no adjustment for inflation.
Currently insured status. A worker is currently insured when he or she has accumulated six quarters of coverage during the 13 -quarter period ending with the current quarter.
Current-payment status. Status of a beneficiary to whom a benefit is being paid for a given month (with or without deductions, provided the deductions add to less than a full month's benefit).
Deemed filing. Under certain circumstances, a person applying for or receiving either an aged-spouse benefit or a retired-worker benefit is required to also file for the other of these two types of benefits. For those first eligible for benefits before 2016, this requirement applies to any person under normal retirement age who is eligible for the other benefit as of the starting month for the first benefit. For those first eligible for benefits in 2016 and later, this requirement applies whenever the person is eligible for the other benefit. This can occur at any age, and in months after the starting month of the first benefit.
Deemed wage credit. See "Military service wage credits."
Delayed retirement credits. Increases in the benefit amount for certain individuals who did not receive benefits for months after attaining normal retirement age but before age 70. Delayed retirement credits apply to benefits for

January of the year following the year they are earned or for the month of attainment of age 70, whichever comes first. See table V.C3.
Demographic assumptions. See "Assumptions."
Disability. For Social Security purposes, the inability to engage in any substantial gainful activity (see "Substantial gainful activity-SGA") by reason of any medically determinable physical or mental impairment that can be expected to result in death or to last for a continuous period of not less than 12 months. Special rules apply for workers at ages 55 and over whose disability is based on blindness.
The law generally requires that a person be disabled continuously for 5 months before he or she can qualify for a disabled-worker benefit.
Disability conversion ratio. For a given year, the ratio of the number of disability conversions to the average number of disabled-worker beneficiaries at all ages during the year.
Disability conversion. Upon attainment of normal retirement age, a dis-abled-worker beneficiary is automatically converted to retired-worker status.
Disability incidence rate. The proportion of workers in a given year, insured for but not receiving disability benefits, who apply for and are awarded disability benefits.
Disability Insurance (DI) Trust Fund. See "Trust fund."
Disability insured status. A worker is disability insured if he or she is: (1) a fully insured worker who has accumulated 20 quarters of coverage during the 40 -quarter period ending with the current quarter, (2) a fully insured worker aged 24-30 who has accumulated quarters of coverage during onehalf of the quarters elapsed after the quarter of attainment of age 21 and up to and including the current quarter, or (3) a fully insured worker under age 24 who has accumulated six quarters of coverage during the 12 -quarter period ending with the current quarter.
Disability prevalence rate. The proportion of persons insured for disability benefits who are disabled-worker beneficiaries in current-payment status.
Disability termination rate. The proportion of disabled-worker beneficiaries in a given year whose disability benefits terminate as a result of their recovery or death.
Disabled-worker benefit. A monthly benefit payable to a disabled worker under normal retirement age and insured for disability. Before November 1960, disability benefits were limited to disabled workers aged 50-64.
Dual entitlement. A person may be entitled to more than one benefit at the same time. For example, a person may be entitled as a retired worker on his or her own record and as a spouse on another record. However, a person's benefit amount can never exceed the highest single benefit to which that per-
son is entitled. Some benefits are calculated independently with the larger benefit being paid or the smaller benefit being paid plus the excess amount of the larger one.
Earnings. Unless otherwise qualified, all wages from employment and net earnings from self-employment, whether or not they are taxable or covered.
Earnings test. The provision requiring the withholding of benefits if beneficiaries under normal retirement age have earnings in excess of certain exempt amounts. See table V.C1.
Economic assumptions. See "Assumptions."
Effective interest rate. See "Interest rate."
Excess wages. Wages in excess of the contribution and benefit base on which a worker initially makes payroll tax contributions, usually as a result of working for more than one employer during a year. Employee payroll taxes on excess wages are refundable to affected employees, while the employer taxes are not refundable.
Expenditures. Actual payments made or expected to be made under current law, including benefits paid or payable, administrative expenses, financial interchange with the Railroad Retirement program, and payments for vocational rehabilitation services for disabled beneficiaries. Includes only the portion of cost that is payable with the financing provisions in current law.
Exposed population. For any event (such as being awarded a benefit, or dying), the group that is exposed to the possibility of experiencing the event. For example, the exposed population for disabled worker awards (incidence) is the disability insured population less those already receiving benefits.
Federal Insurance Contributions Act-FICA. Provision authorizing payroll taxes on the wages of employed persons to provide for Old-Age, Survivors, and Disability Insurance, and for Hospital Insurance. Workers and their employers generally pay the tax in equal amounts.
Financial interchange. Provisions of the Railroad Retirement Act providing for transfers between the trust funds and the Social Security Equivalent Benefit Account of the Railroad Retirement program in order to place each trust fund in the same financial position it would have been had railroad employment always been covered under Social Security.
Fiscal year. The accounting year of the United States Government. Starting in 1976, a fiscal year is the 12-month period ending September 30. For example, fiscal year 2024 began October 1, 2023, and will end September 30, 2024.
Full advance funding. A financing method in which contributions are established to match the full cost of future benefits as these costs are incurred through current service. Such financing methods also provide for amortization over a fixed period of any financial obligation that is incurred at the

## Appendices

beginning of the program (or subsequent modification) as a result of granting credit for past service.
Fully insured status. A worker is fully insured when his or her total number of quarters of coverage is greater than or equal to the number of years elapsed after the year of attainment of age 21 (but not less than six). Once a worker has accumulated 40 quarters of coverage, he or she remains permanently fully insured.
General Fund of the Treasury. Funds held by the Treasury of the United States, other than income collected for a specific purpose (such as Social Security) and maintained in a separate account for that purpose.
General Fund reimbursements. Payments from the General Fund of the Treasury to the trust funds for specific items defined in the law, including:

- The cost of noncontributory wage credits for military service before 1957, and periodic adjustments of previous determinations.
- The cost in 1971-82 of deemed wage credits for military service performed after 1956.
- The cost of benefits to certain uninsured persons who attained age 72 before 1968.
- The cost of payroll tax credits provided to employees in 1984 and selfemployed persons in 1984-89 by Public Law 98-21.
- The cost in 2009-17 of excluding certain self-employment earnings from SECA taxes under Public Law 110-246.
- Payroll tax revenue forgone under the provisions of Public Laws 111147, 111-312, 112-78, and 112-96.
- A portion of proceeds from repayments of loans authorized under Public Law 116-136.
The General Fund also reimburses the trust funds for various other items, including interest on checks which are not negotiated 6 months after the month of issue and costs incurred in performing certain legislatively mandated activities not directly related to administering the OASI and DI programs.
Gross domestic product-GDP. The total dollar value of all goods and services produced by labor and property located in the United States, regardless of who supplies the labor or property.
Hospital Insurance (HI) contribution base. Annual dollar amount above which earnings in employment covered under the HI program are not taxable. (Also referred to as maximum contribution base, taxable maximum, and maximum taxable.) Beginning in 1994, the HI contribution base was eliminated.
High-cost assumptions. See "Assumptions."

## Hospital Insurance (HI) Trust Fund. See "Trust fund."

Immigration. See "Lawful permanent resident (LPR) immigration" and "Other-than-LPR immigration."
Income. Income for a given year is the sum of tax revenue on a cash basis (payroll tax contributions and income from the taxation of scheduled benefits), reimbursements from the General Fund of the Treasury, if any, and interest credited to the trust funds.
Income rate. Ratio of non-interest income to the OASDI taxable payroll for the year.
Infinite horizon. The period extending indefinitely into the future.
Inflation. An increase in the general price level of goods and services.
Insured status. The state or condition of having sufficient quarters of coverage to meet the eligibility requirements for retired-worker or disabled-worker benefits, or to permit the worker's spouse and children or survivors to establish eligibility for benefits in the event of his or her disability, retirement, or death. See "Quarter of coverage."
Interest. A payment in exchange for the use of money during a specified period.
Interest rate. Interest rates on new public-debt obligations issuable to Federal trust funds (see "Special public-debt obligation") are determined monthly. Such rates are equal to the average market yield on all outstanding marketable U.S. securities not due or callable until after 4 years from the date the rate is determined. See table V.B2 for historical and assumed future interest rates on new special-issue securities. The effective interest rate for a trust fund is the ratio of the interest earned by the fund over a given period of time to the average level of asset reserves held by the fund during the period. The effective rate of interest thus represents a measure of the overall average interest earnings on the fund's portfolio of investments. See table VI.G6 for projected compound new-issue interest factors and compound effective trustfund interest factors.
Interfund borrowing. The borrowing of asset reserves by a trust fund (OASI, DI, or HI ) from another trust fund when the first fund is in danger of depletion. The Social Security Act permitted interfund borrowing only during 1982 through 1987, and required all amounts borrowed to be repaid prior to the end of 1989. The only exercise of this authority occurred in 1982, when the OASI Trust Fund borrowed from the DI and HI Trust Funds. The final repayment of borrowed amounts occurred in 1986.
Intermediate assumptions. See "Assumptions."
Lawful permanent resident (LPR) immigration. The flow of persons who enter the Social Security area population and are granted LPR status, or who are already in the Social Security area population and adjust their status to become LPRs. Persons who enter the country with legal visas but without

## Appendices

LPR status, such as temporary foreign workers and students, are not included in the LPR immigration category.
Legal emigration. The flow of lawful permanent residents and citizens who leave the Social Security area population.
Life expectancy. Average remaining number of years expected prior to death. Period life expectancy is calculated for a given year using the actual or expected death rates at each age for that year. Cohort life expectancy, sometimes referred to as generational life expectancy, is calculated for individuals at a specific age in a given year using actual or expected death rates from the years in which the individuals would actually reach each succeeding age if they survive.
Long-range. The first 75 projection years. The Trustees make long-range actuarial estimates for this period because it covers approximately the maximum remaining lifetime for virtually all current Social Security participants.
Low-cost assumptions. See "Assumptions."
Lump-sum death payment. A lump sum, generally $\$ 255$, payable on the death of a fully or currently insured worker. The lump sum is payable to the surviving spouse of the worker, under most circumstances, or to the worker's children.
Maximum family benefit. The maximum monthly amount that can be paid on a worker's earnings record. Whenever the total of the individual monthly benefits payable to all the beneficiaries entitled on one earnings record exceeds the maximum, each dependent's or survivor's benefit is proportionately reduced. Benefits payable to divorced spouses or surviving divorced spouses are not reduced under the family maximum provision.
Medicare. A nationwide, Federally administered health insurance program authorized in 1965 under Title XVIII of the Social Security Act to cover the cost of hospitalization, medical care, and some related services for most persons age 65 and over. In 1972, lawmakers extended coverage to persons receiving Social Security Disability Insurance payments for 2 years and persons with End-Stage Renal Disease. (For beneficiaries whose primary or secondary diagnosis is Amyotrophic Lateral Sclerosis, the 2 -year waiting period is waived.) In 2010, persons exposed to environmental health hazards within areas under a corresponding emergency declaration became Medicare-eligible. In 2006, prescription drug coverage was added as well. Medicare consists of two separate but coordinated trust funds-Hospital Insurance (HI, Part A) and Supplementary Medical Insurance (SMI). The SMI Trust Fund is composed of two separate accounts - the Part B account and the Part D account. Almost all persons who are aged 65 and over or disabled and who are entitled to HI are eligible to enroll in Part B and Part D on a voluntary basis by paying monthly premiums.

Military service wage credits. Credits toward OASDI earnings records for benefit computation purposes, recognizing that military personnel receive non-wage compensation (such as food and shelter) in addition to their basic pay and other cash payments. Military personnel do not pay payroll taxes on these credits. Noncontributory wage credits of $\$ 160$ were provided for each month of active military service from September 16, 1940, through December 31, 1956. For years after 1956, the basic pay of military personnel is covered under the Social Security program on a contributory basis. In addition to the contributory credits for basic pay, noncontributory wage credits of $\$ 300$ were granted for each calendar quarter, from January 1957 through December 1977, in which a person received pay for military service. Noncontributory wage credits of $\$ 100$ were granted for each $\$ 300$ of military wages, up to a maximum credit of \$1,200 per calendar year, from January 1978 through December 2001.
National average wage index-AWI. See "Average wage index-AWI."
Non-interest income. Non-interest income for a given year is the sum of tax revenue on a cash basis (payroll tax contributions and income from the taxation of scheduled benefits) and reimbursements from the General Fund of the Treasury, if any.
Nonresident alien beneficiary. An OASDI beneficiary who is not a U.S. citizen and who is living abroad while receiving benefits.
Normal retirement age-NRA. The age at which a person may first become entitled to retirement benefits without reduction based on age. For persons reaching age 62 before 2000, the normal retirement age is 65 . It increases gradually to 67 for persons reaching age 62 in 2022 or later, beginning with an increase to 65 years and 2 months for persons reaching age 62 in 2000. See table V.C3.
Old-Age and Survivors Insurance (OASI) Trust Fund. See "Trust fund."
Old-law base. Amount the contribution and benefit base would have been if the 1977 amendments had not provided for ad hoc increases. The Social Security Amendments of 1972 provided for automatic annual indexing of the contribution and benefit base. The Social Security Amendments of 1977 specified ad hoc bases for 1978-81, with subsequent bases updated in accordance with the normal indexing procedure. See table V.C2.
Open-group unfunded obligation. See "Unfunded obligation."
Other-than-LPR emigration. The flow of other-than-LPR immigrants who leave the Social Security area population or who adjust their status to become LPRs.
Other-than-LPR immigration. The flow of persons who enter the Social Security area population and stay to the end of the year without being

## Appendices

granted LPR status, such as undocumented immigrants, and foreign workers and students entering with temporary visas.
Par value. The value printed on the face of a bond. For special issues held by the trust funds, par value is the redemption value at any time up to maturity.
Partial advance funding. A financing method in which contribution levels are established to provide a substantial accumulation of trust fund asset reserves, thereby generating interest income to the trust funds and reducing the need for contribution increases or cost reductions in periods when costs are relatively high or income is relatively low. The trust fund buildup under partial advance funding is smaller than it would be with full advance funding.
Pay-as-you-go financing. A financing method in which contribution levels are established with the intent to produce annual income levels required to pay current benefits, with trust fund asset reserves built up only to the extent needed to prevent immediate depletion of the fund reserves by random fluctuations.
Payroll tax contributions. The amount based on a percent of earnings, up to an annual maximum, that must be paid by:

- employers and employees on wages from employment under the Federal Insurance Contributions Act,
- the self-employed on net earnings from self-employment under the Self-Employment Contributions Act, and
- States on the wages paid in 1986 and earlier to State and local government employees covered under the Social Security Act through voluntary agreements under section 218 of the act.
Also referred to as payroll taxes.
Present value. The interest-adjusted equivalent value, at the present time, of a stream of values (either positive or negative, past or future). Present value is used widely in calculations involving financial transactions over long periods of time to account for the time value of money, by discounting or accumulating these transactions at the rate of interest. Present-value calculations for this report use the effective yield on combined OASI and DI Trust Fund asset reserves.
Primary insurance amount-PIA. The monthly amount payable to a retired worker who begins to receive benefits at normal retirement age or, generally, to a disabled worker. This amount, which is typically related to the worker's average monthly wage or average indexed monthly earnings, is also used as a base for computing all types of benefits payable on an individual's earnings record.

Primary-insurance-amount formula. The mathematical formula relating the PIA to the AIME for workers who attain age 62, become disabled, or die after 1978. The PIA is equal to the sum of 90 percent of AIME up to the first bend point, plus 32 percent of AIME above the first bend point up to the second bend point, plus 15 percent of AIME in excess of the second bend point. Automatic benefit increases are applied beginning with the year of eligibility. See table V.C2 for historical and assumed future bend points and table V.C1 for historical and assumed future benefit increases.
Quarter of coverage. Basic unit of measurement for determining insured status. For 1978, a worker earned one quarter of coverage, up to four, for each $\$ 250$ of that worker's annual covered earnings. After 1978, the $\$ 250$ amount increases automatically with increases in the national average wage index. See table V.C2.
Railroad Retirement. A Federal insurance program, similar to Social Security, designed for workers in the railroad industry. The provisions of the Railroad Retirement Act provide for a system of coordination and financial interchange between the Railroad Retirement program and the Social Security program.
Reallocation of payroll tax rates. An increase in the payroll tax rate for either the OASI or DI Trust Fund, with a corresponding reduction in the rate for the other fund, so that the total OASDI payroll tax rate is not changed.
Recession. A period of adverse economic conditions, generally defined as two or more successive calendar quarters of negative real growth in gross domestic product.
Reserves. See "Trust fund reserves."
Retired-worker benefit. A monthly benefit payable to a fully insured retired worker aged 62 or older or to a person entitled under the transitionally insured status provision in the law.
Retirement earnings test. See "Earnings test."
Retirement eligibility age. The age, currently age 62 , at which a fully insured individual first becomes eligible to receive retired-worker benefits.
Scheduled benefits. The level of benefits specified under current law.
Scenario-based model. A model with specified assumptions for and relationships among variables. Under such a model, any specified set of assumptions determines a single outcome directly reflecting the specifications.
Self-employment. Operation of a trade or business by an individual or by a partnership in which an individual is a member.
Self-Employment Contributions Act-SECA. Provision authorizing Social Security payroll taxes on the net earnings of most self-employed persons.
Short-range. The first 10 projection years. The Social Security Act requires estimates for 5 years; the Trustees prepare estimates for an additional 5 years

## Appendices

to help clarify trends that are only starting to develop in the mandated first 5year period.
Social Security Act. Provisions of the law governing most operations of the Social Security program. The original Social Security Act is Public Law 74-271, enacted August 14, 1935. With subsequent amendments, the Social Security Act consists of 21 titles, of which three have been repealed. Title II of the Social Security Act authorizes the Old-Age, Survivors, and Disability Insurance program.
Social Security area population. The population composed of: (1) residents of the 50 States and the District of Columbia (adjusted for net census undercount); (2) civilian residents of Puerto Rico, the Virgin Islands, Guam, American Samoa, and the Northern Mariana Islands; (3) Federal civilian employees and persons in the U.S. Armed Forces abroad and their dependents; (4) non-citizens living abroad who are insured for Social Security benefits; and (5) all other U.S. citizens abroad.
Solvency. A program is solvent at a point in time if it is able to pay scheduled benefits when due with scheduled financing. For example, the OASDI program is solvent over any period for which the trust funds maintain a positive level of asset reserves.
Special public-debt obligation. Securities of the United States Government issued exclusively to the OASI, DI, HI, and SMI Trust Funds and other Federal trust funds. Section 201(d) of the Social Security Act provides that the public-debt obligations issued for purchase by the OASI and DI Trust Funds shall have maturities fixed with due regard for the needs of the funds. The usual practice has been to spread the holdings of special issues, as of each June 30 , so that the amounts maturing in each of the next 15 years are approximately equal. Special public-debt obligations are redeemable at par value at any time and carry interest rates determined by law (see "Interest rate"). See tables VI.A4 and VI.A5 for a listing of the obligations held by the OASI and DI Trust Funds, respectively.
Stochastic model. A model used for projecting a probability distribution of potential outcomes. Such models allow for random variation in one or more variables through time. The random variation is generally based on fluctuations observed in historical data for a selected period. A large number of simulations, each of which reflects random variation in the variable(s), produce a distribution of potential outcomes.
Substantial gainful activity-SGA. The level of work activity used to establish disability. A finding of disability requires that a person be unable to engage in substantial gainful activity. A person who earns more than a certain monthly amount (net of impairment-related work expenses) is ordinarily considered to be engaging in SGA. The amount of monthly earnings considered as SGA depends on the nature of a person's disability. The Social Security Act specifies a higher SGA amount for statutorily blind individuals;

Federal regulations specify a lower SGA amount for non-blind individuals. Both SGA amounts increase with increases in the national average wage index.
Summarized balance. The difference between the summarized income rate and the summarized cost rate, expressed as a percentage of GDP. The difference between the summarized income rate and cost rate as a percentage of taxable payroll is referred to as the actuarial balance.
Summarized cost rate. The ratio of the present value of cost to the present value of the taxable payroll (or GDP) for the years in a given period, expressed as a percentage. To evaluate the financial adequacy of the program, the summarized cost rate is adjusted to include the cost of reaching and maintaining a target trust fund level. A trust fund level of about 1 year's cost is considered to be an adequate reserve for unforeseen contingencies; therefore, the targeted trust fund ratio is 100 percent of annual cost. Accordingly, the adjusted summarized cost rate is equal to the ratio of: (1) the sum of the present value of the cost during the period plus the present value of the targeted ending trust fund level to (2) the present value of the taxable payroll (or GDP) during the projection period.
Summarized income rate. The ratio of the present value of scheduled noninterest income to the present value of taxable payroll (or GDP) for the years in a given period, expressed as a percentage. To evaluate the financial adequacy of the program, the summarized income rate is adjusted to include asset reserves on hand at the beginning of the period. Accordingly, the adjusted summarized income rate equals the ratio of: (1) the sum of the trust fund reserve at the beginning of the period plus the present value of noninterest income during the period to (2) the present value of the taxable payroll (or GDP) for the years in the period.
Supplemental Security Income-SSI. A Federally administered program (often with State supplementation) of cash assistance for needy aged, blind, or disabled persons. The General Fund of the Treasury funds Federal expenditures for the SSI program. The Social Security Administration administers it.
Supplementary Medical Insurance (SMI) Trust Fund. See "Trust fund."
Survivor benefit. Benefit payable to a survivor of a deceased worker.
Sustainable solvency. Sustainable solvency for the financing of the program under a specified set of assumptions is achieved when the projected trust fund ratio is positive throughout the 75 -year projection period and is either stable or rising at the end of the period.
Taxable earnings. Wages or self-employment income, in employment covered by the OASDI or HI programs, that is under the applicable annual maxi-

## Appendices

mum taxable limit. For 1994 and later, no maximum taxable limit applies to the HI program.
Taxable payroll. A weighted sum of taxable wages and taxable self-employment income. When multiplied by the combined employee-employer payroll tax rate, taxable payroll yields the total amount of payroll taxes incurred by employees, employers, and the self-employed for work during the period.
Taxable self-employment income. The maximum amount of net earnings from self-employment by an earner which, when added to any taxable wages, does not exceed the contribution and benefit base. For HI beginning in 1994, all net earnings from self-employment.
Taxable wages. See "Taxable earnings."
Taxation of benefits. Beginning in 1984, up to 50 percent of an individual's or a couple's OASDI benefits is potentially subject to Federal income taxation, depending on the circumstances. The revenue derived from this provision is allocated to the OASI and DI Trust Funds on the basis of the income taxes paid on the benefits from each fund. In 1994, the maximum percentage of benefits potentially subject to taxation was increased from 50 percent to 85 percent. The additional tax revenue derived from taxation of benefits in excess of 50 percent, up to 85 percent, is allocated to the HI Trust Fund.
Taxes. See "Payroll tax contributions" and "Taxation of benefits."
Termination. Cessation of payment because the beneficiary is no longer entitled to receive a specific type of benefit. For example, benefits might terminate as a result of the death of the beneficiary, the recovery of a disabled beneficiary, or the attainment of age 18 by a child beneficiary. In some cases, an individual may cease one benefit and this is not a termination because they become immediately entitled to another type of benefit, such as the conversion of a disabled-worker beneficiary at normal retirement age to a retired-worker beneficiary.
Test of long-range close actuarial balance. The conditions required to meet this test are:

- The trust fund satisfies the test of short-range financial adequacy; and
- The trust fund ratio stays above zero throughout the 75-year projection period, such that benefits would be payable in a timely manner throughout the period.
The Trustees apply the test to OASI, DI, and the combined OASDI program based on the intermediate set of assumptions.
Test of short-range financial adequacy. The conditions required to meet this test are:
- If the trust fund ratio is at least 100 percent at the beginning of the 10 -year projection period, then it must remain at or above 100 percent throughout the entire projection period;
- If the ratio is initially less than 100 percent, then it must reach at least 100 percent within 5 years (without reserve depletion at any time during this period) and then remain at or above 100 percent throughout the remainder of the 10 -year period.
The Trustees apply the test to OASI, DI, and the combined OASDI program based on the intermediate set of assumptions.
Total-economy productivity. The ratio of real GDP to hours worked by all workers. Also referred to as "labor productivity."
Total fertility rate. The sum of the single-year-of-age birth rates for girls and women aged 14 through 49 , where the rate for age 14 includes births to girls aged 14 and under, and the rate for age 49 includes births to women aged 49 and over. The total fertility rate may be interpreted as the average number of children that would be born to a woman if she were to experience, at each age of her life, the birth rate observed in, or assumed for, a specified year, and if she were to survive the entire childbearing period.
Trust fund. Separate accounts in the United States Treasury which hold the payroll taxes received under the Federal Insurance Contributions Act and the Self-Employment Contributions Act; payroll taxes resulting from coverage of State and local government employees; any sums received under the financial interchange with the railroad retirement account; voluntary hospital and medical insurance premiums; and reimbursements or payments from the General Fund of the Treasury. As required by law, the Department of the Treasury invests funds not required to meet current expenditures in interestbearing securities backed by the full faith and credit of the U.S. Government. The interest earned is also deposited in the trust funds.
- Old-Age and Survivors Insurance (OASI). The trust fund used for paying monthly benefits to retired-worker (old-age) beneficiaries, their spouses and children, and to survivors of deceased insured workers.
- Disability Insurance (DI). The trust fund used for paying monthly benefits to disabled-worker beneficiaries, their spouses and children, and for providing rehabilitation services to the disabled.
- Hospital Insurance (HI). The Medicare trust fund that covers specified inpatient hospital services, posthospital skilled nursing care, home health services, and hospice care for aged and disabled individuals who meet the eligibility requirements. Also known as Medicare Part A.
- Supplementary Medical Insurance (SMI). The Medicare trust fund composed of the Part B Account, the Part D Account, and the Transitional Assistance Account. The Part B Account pays for a portion of the costs of physicians' services, outpatient hospital services, and other related medical and health services for voluntarily enrolled aged and disabled individuals. The Part D Account pays private plans to provide

## Appendices

prescription drug coverage, beginning in 2006. The Transitional Assistance Account paid for transitional assistance under the prescription drug card program in 2004 and 2005.
The trust funds are distinct legal entities which operate independently. Fund operations are sometimes combined on a hypothetical basis.
Trust fund ratio. A measure of trust fund adequacy. The asset reserves at the beginning of a year (equal to the reserves at the end of the prior year), which do not include advance tax transfers, expressed as a percentage of the cost for the year. The trust fund ratio represents the proportion of a year's cost which could be paid solely with the reserves at the beginning of the year.
Trust fund reserve depletion. The point at which reserves in a trust fund are insufficient to pay scheduled benefits in full and on time.
Trust fund reserves. The cumulative excess of trust fund income over trust fund cost over all years to date. These reserves are held by the trust funds in the form of Treasury notes and bonds, other securities guaranteed by the Federal Government, certain Federally sponsored agency obligations, and cash.
Trustees. See "Board of Trustees."
Undisbursed balances. In general, refers to the cumulative differences between the actual cash payments for a month compared to security redemptions from the trust fund reserves made on a preliminary basis to cover such cash payments during the same month. On a monthly basis, the Social Security Administration (SSA) pays benefits and makes payments for other programmatic expenses associated with the trust funds. During each month, SSA draws cash from the trust funds on a preliminary basis, which results in Treasury redeeming invested securities to cover such payments. This monthly difference can be either positive or negative depending on net monthly activity, and is added to the balance from the end of the prior month.
A net positive undisbursed balance represents a situation where cumulative redemptions from the trust fund's securities are more than was needed to cover actual program cash payments through the end of the month. A net negative balance represents a situation where cumulative program cash payments exceeded the amount redeemed from the invested securities. A negative value requires future redemption of additional invested securities.
In addition, about every seven years, when January 3 falls on a Sunday, benefit payments scheduled to be paid on January 3rd are actually paid on December 31 of the preceding year, as required by the statutory provision included in the 1977 Social Security Amendments for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. Consistent with practice in prior reports and for comparability with other historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment in each year. Therefore, such advance payments are
included as positive values in the undisbursed balance at the end of the calendar years in which the advance payments are made.
Unfunded obligation. A measure of the shortfall of trust fund income to fully cover program cost through a specified date after depletion of trust fund asset reserves. This measure can be expressed in present value dollars, discounted to the beginning of the valuation period, by computing the excess of the present value of the projected cost of the program through a specified date over the sum of: (1) the value of trust fund reserves at the beginning of the valuation period; and (2) the present value of the projected non-interest income of the program through a specified date, assuming scheduled tax rates and benefit levels. This measure can apply for all participants through a specified date, i.e., the open group, or be limited to a specified subgroup of participants.
Unfunded obligation ratio. The unfunded obligation accumulated through the beginning of a year expressed as a percentage of the cost for the year.
Unnegotiated check. A check which has not been cashed 6 months after the end of the month in which the check was issued. When a check has been outstanding for a year, the Department of the Treasury administratively cancels the check and reimburses the issuing trust fund separately for the amount of the check and interest for the period the check was outstanding. The appropriate trust fund also receives an interest adjustment for the time the check was outstanding if it is cashed 6 to 12 months after the month of issue. If a check is presented for payment after it has been administratively canceled, a replacement check is issued.
Valuation period. A period of years which is considered as a unit for purposes of calculating the financial status of a trust fund.
Vocational rehabilitation (VR). Services provided to disabled persons to help them to return to gainful employment. VR services are designed to provide an individual with the training or other services that are needed to return to work, to begin working, or to enter a new line of work. The trust funds, and the General Fund in the case of individuals also receiving Supplemental Security Income disability benefits, reimburse the providers of such services only in those cases where the services contributed to the successful rehabilitation of the beneficiaries.

## STATEMENT OF ACTUARIAL OPINION

It is my opinion that: (1) the techniques and methodology used herein to evaluate the actuarial status of the Federal Old-Age and Survivors Insurance and Disability Insurance Trust Funds are based upon sound principles of actuarial practice and are generally accepted within the actuarial profession; and (2) the assumptions used and the resulting actuarial estimates are, individually and in the aggregate, reasonable for the purpose of evaluating the actuarial status of the trust funds, taking into consideration the past experience and future expectations for the population, the economy, and the program. I am a member of the American Academy of Actuaries and I meet the Qualification Standards of the American Academy of Actuaries to render this actuarial opinion.

Stephen C. Goss

# Social Security Actuarial Status <br> The 2024 Annual Report of the Board of Trustees of the OASI and DI Trust Funds 

Key Changes and Results Under Intermediate Assumptions

```
AMERICAN ACADEMY OF ACTUARIES WEBINAR MAY 22, 2024
    PREPARED BY THE OFFICE OF THE CHIEF ACTUARY, SSA
```

## What is the Legislative Mandate for the Social Security Annual Report?

1. Trust Fund operations of the past year and the next five years
2. Actuarial status of the trust funds

- This means the ability to meet the cost of scheduled benefits with scheduled revenue and trust fund reserves
- And the extent to which scheduled revenue would fall short under current law, indicating the size of legislative changes that will be needed

The report has been produced every year starting in 1941!

Changes in the 2024 Trustees Report

## Three Primary Changes This Year

1. Economic: Given the unanticipated strength of the economy through 2023, the Trustees increased the level of labor productivity and the employment rate over the projection period. This offset the 3-percent permanent drop in the level of labor productivity and GDP assumed in last year's report.
2. Disability: The assumed ultimate disabled worker incidence rate was lowered from 4.8 to 4.5 per thousand, as applications for and awards of disability benefits have continued at low levels.
3. Demographic: The assumed ultimate total fertility rate (TFR) was lowered from 2.0 children per woman reached in 2056 to 1.9 children per woman reached in 2040, given continued low level of the TFR in recent years.

OASDI actuarial deficit now at 3.50 percent of payroll, down from 3.61 in 2023 report.

## Primary Change 1: Higher GDP Level in 2024 TR Than in 2023 TR

As a result of recent economic developments, including strong growth in 2023, the assumed sustainable trend level of GDP for the 2024 TR is assessed to be about 3 percent higher than the level assumed in the 2023 TR.

The assumed ultimate trend growth rate of GDP is the same in both the 2023 and 2024 reports.

## Real GDP

(billions of 2017 dollars, adjusted for NIPA methodological changes,

## Primary Change 2: Applications for Disability Benefits Remain Near Historically Low Level

At the peak of the last economic cycle in 2007, applications were low, but increased rapidly in the 2008 recession from 1.5 million in 2007 to 1.9 million in 2010.

In 2017 through 2022, applications have dropped below the 2007 level.

Applications increased in 2023 but remain near historically low levels.

Social Security Disabled Worker Receipts at Disability Determination Services by Calendar Year: Historical and Intermediate Assumptions for 2012 through 2024 Trustees Reports

## Primary Change 2: Disability Incidence Rate Also Remains At Historic Low Level

DI disabled worker incidence rate rose sharply in the 2008 recession and has declined since the peak in 2010 to extraordinarily low levels in 2016 through 2022.

Incidence rates increased slightly in 2023 and are projected to surge in order to reduce pending claims (assuming increased staffing).

Note recent rise in pending claims due to limited staffing: see Actuarial Note 163.

## DI Age-Sex-Adjusted Incidence Rates:

Historical and Intermediate Assumptions for 2012 through 2024 Trustees Reports

## Primary Change 2: Fewer Disabled Worker Beneficiaries

Fewer now and in near term based on recent applications and incidence rates.

## Primary Change 3:

 Reduce Ultimate Total Fertility Rate from 2.0 to 1.9Average "Adjusted" Total Fertility Rate falls from 3 to 2 after 1965.

Will birth rates rebound from recent historic low as in 1990-2008? If so, by how much? How about immigration?
U.S. Total Fertility Rate: With and Without Adjustment for Survival to Age 10

Notes: TFRs prior to 1917 are for whites only and survival rates prior to 1900 use Massachusetts data only.

## Primary Change 3: <br> Birth Rates by Cohort

Have been rising for women born since 1954.

Under intermediate assumptions, birth rates are projected to go below 2.0 for women born after 1990, reaching an assumed ultimate level of 1.9.

Chart 1.4: Historical and Projected Total Fertility Rates by Birth Cohort

2024 Trustees Report Results

## Solvency: OASI+DI Trust Fund Reserve Depletion in 2035 (one year later than last year)

OASDI reserve depletion date varied from 2033 to 2035 in reports over the last 13 years (2012-2024) and from 2029 to 2042 in reports over the last 34 years (1991-2024).

OASI reserve depletion date now November 2033 versus April 2033 in the 2023 report.

DI Trust Fund: reserves do not deplete, due largely to continued low applications and awards, and a lower assumed ultimate disability incidence rate.

## OASDI Annual Cost and Non-Interest Income as Percent of Taxable Payroll, 2023 TR vs. 2024 TR

Persistent negative annual cash-flow balance starting in 2010.

83 percent of scheduled benefits still payable at trust fund reserve depletion: was 80 percent in last year's report.

73 percent payable for 2098: was 74 percent for 2097 in last year's report.

## Changes in OASDI Annual Balance

Annual income rate minus annual cost rate.

Annual deficits are lower through 2077 and higher thereafter.

The decreased annual deficits are mainly due to changes in economic factors and the lower assumed ultimate disability incidence rate, which are gradually offset by the lower recent and assumed ultimate total fertility rate.

OASDI Annual Balances: 2023 and 2024 Trustees Reports

## SUSTAINABILITY: Cost as percent of GDP 2023 TR vs. 2024 TR

Rises from a 4.2 percent average in 1990-2008, to a peak of about 6.4 percent for 2078, and then declines to 6.1 percent by 2098.

## Changes in Timing of Trust Fund Reserve Depletion in 2024 Report

1. OASDI reserve depletion is 2035: 13 months later than last year's report
a) Economic and disability changes are positive for the trust funds throughout the 75 -year projection
b) The change in the fertility rate assumption partially offsets the economic and disability changes in the long-term - but not until well after 2035
2. OASI reserve depletion is again 2033: but 7 months later than in last year's report
3. DI reserves do not become depleted over the 75-year long-range projection period: same as last year
a) Applications and benefit awards are both near historically low levels in 2023
b) Reduced ultimate incidence rate
c) Gradual increase in initial applications to their ultimate level

## Year of OASDI Combined Trust Fund Reserve Depletion

OASDI reserve depletion date varied from 2033 to 2035 in reports over the last 13 years (2012-2024) and from 2029 to 2042 in reports over the last 34 years (1991-2024).

Year of OASDI Combined Trust Fund Reserve Depletion
Between 2029 and 2042 for 34 Years, 1991 through 2024 Reports

## Reasons for Change in Actuarial Balance in 2024 Trustees Report

## Actuarial Balance: Net Change of $+\mathbf{0 . 1 1}$ percent of payroll

Valuation Period - Changes the actuarial balance by

- 0.06 percent of payroll

Legislation etc. - Changes the actuarial balance by
0.00 percent of payroll

- One-year delay in resuming approval of new DACA applications

Demographic Data/Assumptions - Changes the actuarial balance by

- Lower ultimate total fertility rate with ultimate rate reached sooner
- Recent birth data and slightly lower assumed near-term total fertility rates
- Higher near-term mortality rates due to ongoing effects of COVID-19
- New data for mortality, immigration, marriage/divorce, and historical population

Economic Data/Assumptions - Changes the actuarial balance by

- New data for educational attainment
- New historical OASDI covered employment data
- New data and other near-term economic assumptions - increase in assumed level of labor productivity
- 0.16 percent of payroll
(-0.10 percent)
(-0.03 percent)
(+0.01 percent)
(-0.03 percent)
+0.13 percent of payroll
(+0.02 percent)
(+0.05 percent)
(+0.06 percent)

Disability Data/Assumptions - Changes the actuarial balance by

- New disability data, near-term assumptions and lower ultimate disability incidence rates
- Disability incidence rate assumptions incorporated into labor force model

## Methods and Programmatic Assumptions

- Methodological improvements, programmatic data and other improvements and updates
+0.12 percent of payroll
(+0.08 percent)
(+0.03 percent)
+0.08 percent of payroll

Why are we now facing OASDI Trust Fund reserve depletion in 2035, almost 30 years earlier than projected in the 1983 report, after enactment of the 1983 Amendments?

Not due to increased longevity_projected life expectancy at age 65 in the 1983 report was extremely accurate.

## Aging -

 Change in Age DistributionThis is the primary reason for increasing cost relative to payroll and GDP.

Mainly due to drop in birth rates.

However, this was also known and anticipated in 1983.

## The Main Issue:

 Drop in Ratio of Taxable Earnings to All OASDI Covered EarningsDeclined since 1983 due to increasing concentration of earnings at the top of the distribution. Between 1983 and 2000, the average annual earnings for the top 6 percent of earners rose 62 percent more than CPI, but only 17 percent more for the other 94 percent of earners.

The ratio dropped to 82.5 percent by 2000 and has remained there except for cyclic effects.

This drop was NOT anticipated in 1983.

Taxable Ratio 2024 TR

## OASDI-Covered Wages in Excess of the Taxable Maximum

The share of workers with wages exceeding the OASDI taxable maximum remained fairly stable around 6 percent.

The share of wages in excess of the OASDI taxable maximum has generally risen since 1983 and it stood at 17.9 percent in 2021 (the latest historical data available).

## Selected Other Assumptions of Interest to Actuaries...

## Mortality

Experience: Ages Under 65

Increased mortality in 2020-24 to reflect the effects of the COVID-19 pandemic.

Age-Sex-Adjusted Death Rates (per 100,000) Ages Under 65

## "Deaths of <br> Despair" by Cause of Death Category

Age-Sex-Adjusted Death Rates Under Age 65

Under 65 Age-Sex-Adjusted Rates, per 100,000, for Deaths of Despair, by Category

199920002001200220032004200520062007200820092010201120122013201420152016201720182019202020212022
-Opium poisoning (T40.0)
——Other opioid poisoning (T40.2)
$\rightarrow$ Other synthetic narcotic poisoning (T40.4)
$\rightarrow$ Other unspecified drug poisoning
$\longrightarrow$ Alcohol poisoning (X45, Y15)
$\simeq$ Heroin poisoning (T40.1)

- Methadone poisoning (T40.3)
-Other and unspecified narcotic poisoning (T40.6)
$\longrightarrow$-Suicide (U03, X60-84, Y87.0)
-Alcoholic liver disease/cirrhosis (K70, K73-74)

## Mortality

 Experience: Ages 65 and OlderIncreased mortality in 2020-24 to reflect the effects of the COVID-19 pandemic.

Age-Sex-Adjusted Death Rates (per 100,000)
Ages 65 and Older

## Mortality Experience: All Ages

Increased mortality in 2020-24 to reflect the effects of the COVID-19 pandemic.

What will the net effect of the pandemic be on mortality in the future?

We assume offsetting effects for the residual population after the pandemic.

## Ratio of Employment to Population

Recovered strongly from the brief but steep 2020 recession.

Projected to exceed the level seen at the peak of the last economic cycle.

Projected to be higher than in the 2023 TR in part due to the lower assumed disability incidence rate and higher projected educational attainment.

## Ratio of Employment to Population

## Employment Over Age 65...

declined briefly with the 2020 recession, but is projected to continue rising. How much of this is from changing the NRA and earnings test? Is the best retirement approach a job (Paul Samuelson)?

## Age of Starting Social Security Retirement Benefits

Male Retired Worker Beneficiaries In Current Payment Status as Percent of Insured Population
(excluding those receiving only some other OASDI benefit)

Female Retired Worker Beneficiaries In Current Payment Status as Percent of Insured Population
(excluding those receiving only some other OASDI benefit)

The Broader Retirement Landscape and Effects on Federal Debt

## Replacement Rates Based on the 2024 TR

## Payable Benefits Under the Law, After Trust Fund Reserves Are Depleted, Are Even Lower

Source: Annual Recurring Actuarial Note \#9 at www.ssa.gov/oact/NOTES/ran9/index.html

## Defined Benefit Plans Replaced by DC Plans

Lump sum options increasing for DB plans

Private-Sector Workers Participating in Employment-Based Retirement
Plans, by Plan Type, 1979-2021

Source: Source: U. S. Department of Labor Form 5500 Summaries through 1999.
EBRI estimates 2000-2021 using Bureau of Labor Statistics, Current Population Survey, and U.S. Department of Labor data.

## Social Security Is Not Responsible for the Federal Debt

1) OASI, DI, HI Trust Funds do not add to the debt
2) In fact, these trust funds finance part of the total federal debt
3) These programs cannot borrow under current law
4) The "budget scoring convention" is inconsistent with the law

Sec. 257(b)(1) of the Balanced Budget and Emergency Deficit Control Act of 1985, P.L. 99-177:
"Laws providing or creating direct spending and receipts are assumed to operate in the manner specified in those laws for each such year and funding for entitlement authority is assumed to be adequate to make all payments required by those laws."
Full scheduled payments are not required after trust fund reserve depletion; in fact, they are not even allowed.

## What If We Project Federal Debt Consistent With the Law?

CBO and OMB Budget baselines assume borrowing Trust Funds from the public vs. projections consistent with current law, where OASDHI shortfalls must be met with added revenue or reduced cost; note Trust Fund reserves are part of total federal debt

## How to Eliminate the Social Security Long-Term Actuarial Deficit

## The Bottom Line

- Long-term projections provide information to assess solvency and changes needed to eliminate shortfalls.
- If trust fund reserves were to become depleted:
- Full benefits could not be paid timely
- NO pressure on the Budget or Federal Debt
- So Congress must act, as it always has
- Straightforward solutions:
- Add revenue and/or lower cost for OASDI
- Comprehensive changes implemented by 2035

## Ways to Lower Cost

- Lower benefits for retirees - not disabled?
- Increase normal retirement age (lowers OASI cost, but increases DI cost)
- Can exempt long-career low earners (e.g. Simpson Bowles 2010)
- Lower benefits mainly for high earners?
- Reduce PIA above some level, noting that higher earners generally live longer
- Often combined with increasing PIA below some level, subject to work year requirements
- Lower benefits mainly for the oldest old?
- Reduce the COLA by using the chain-weighted CPI-U
- But some say increase it with the CPI-E (based on purchase of consumers over age 62)

## Ways to Increase Revenue

- Raise the 12.4 percent OASDI payroll tax rate?
- Raise tax on highest earners?
- Increase taxable maximum amount
- Some tax on all earnings above the maximum
- Provide additional benefit credit?
- Tax employer group health insurance premiums?
- Affects only middle class if taxable maximum remains
- Tax investment income?
- Or potentially a wealth tax?

## Timing for Changes

- Historically, Congress has waited until reserve depletion is imminent
- Given uncertainties, difficult to lower benefits or raise taxes until necessary
- Enacting "sooner" allows more options, more gradual phase in, and more advance notice
- Best example: 17-year delay in implementing NRA increase in 1983 amendments
- OASDI reserve depletion now projected for 2035
- As shown earlier, the date has varied between 2029 and 2042 over the past 34 years

[^0]:    ${ }^{1}$ The definitions of "benefit payments" and other terms appear in the Glossary.

[^1]:    ${ }^{1}$ If the OASI Trust Fund reserves were to become depleted in 2033 as is currently projected, the operations of the hypothetical combined OASI and DI Trust Funds would not reflect the aggregated operation of the OASI Trust Fund and the DI Trust Fund because part of the OASI benefits could not be paid without a change in the law. The values shown for the hypothetical combined trust funds assume the law will have been changed to permit the transfer of resources between funds as needed.

[^2]:    ${ }^{1}$ The 3.33 percentage point increase in the payroll tax rate required to achieve 75 -year solvency through 2098 differs somewhat from the 3.50 percent actuarial deficit. This is primarily because the rate increase required to achieve 75 -year solvency reflects a zero trust fund reserve at the end of the period in 2098, whereas the 3.50 percent actuarial deficit incorporates an ending trust fund reserve equal to one year's cost. While such an increase in the payroll tax rate would cause some behavioral changes in earnings and ensuing changes in benefit levels, such changes are not included in these calculations because they are assumed to have roughly offsetting effects on OASDI actuarial status over the 75 -year long-range period as a whole.

[^3]:    ${ }^{1}$ Estimated cost is based on the intermediate set of assumptions.

[^4]:    ${ }^{1}$ Sustainable solvency for the financing of the program under a specified set of assumptions has been achieved when the projected trust fund ratio is positive throughout the 75 -year projection period and is either stable or rising at the end of the period.

[^5]:    ${ }^{1}$ See www.ssa.gov/oact/ProgData/fundsQuery.html.

[^6]:    ${ }^{1}$ Vocational rehabilitation services under the OASI program are furnished to disabled widow(er) beneficiaries and to those children of retired or deceased workers who receive benefits based on disabilities that began before age 22. The trust funds reimburse the providers of such services only in those cases where the services contributed to the successful rehabilitation of the beneficiary.

[^7]:    ${ }^{1}$ The OASI and DI Trust Funds are distinct legal entities which operate independently. To illustrate the actuarial status of the program as a whole, the fund operations are often combined on a hypothetical basis.

[^8]:    ${ }^{1}$ The OASI and DI Trust Funds are distinct legal entities which operate independently. To illustrate the actuarial status of the program as a whole, the fund operations are often combined on a hypothetical basis.
    ${ }^{2}$ The estimates shown in this subsection reflect 12 months of scheduled benefits in each year of the shortrange projection period. In practice, the actual payment dates have at times shifted over calendar year boundaries as a result of the statutory requirement for early delivery of benefit payments when the normal check delivery date is a Saturday, Sunday, or legal public holiday.

[^9]:    ${ }^{1}$ See table IV.B3.
    ${ }^{2}$ See table VI.G6.

[^10]:    ${ }^{a}$ Appendix A presents a detailed description of the components of income and cost, along with complete historical values.
    ${ }^{\text {b }}$ Amounts for 2020 and 2021 are adjusted to include in 2021 operations those benefit payments regularly scheduled in the law to be paid on January 3, 2021, which were actually paid on December 31, 2020 as required by the statutory provision for early benefit payments when the normal delivery date is on a weekend or holiday. Such shifts in payments across calendar years occur periodically whenever January 3rd falls on a Sunday. In order to provide a consistent perspective on trust fund operations over time, all trust fund operations in each year reflect the 12 months of benefits that are regularly scheduled for payment in that year.
    ${ }^{\mathrm{c}}$ Represents reserves at the beginning of a year (which are identical to reserves at the end of the prior year shown in the "Amount at end of year" column) as a percentage of cost for the year. The trust fund ratio at the beginning of 2034 is projected to be 262 percent under the intermediate, 499 percent under the low-cost, and 94 percent under the high-cost assumptions.
    ${ }^{\mathrm{d}}$ Includes adjustments for prior calendar years. For example, in June 2021, an unusually large negative adjustment to payroll tax contributions in the amount of $\$ 5.2$ billion was made because payroll tax revenue credited to the trust fund in 2020 was based on estimates that did not anticipate effects of the pandemic and recession.
    ${ }^{\mathrm{e}}$ Includes reimbursements from the General Fund of the Treasury to the DI Trust Fund for: (1) the cost of payroll tax credits provided to employees in 1984 and self-employed persons in 1984-89 by Public Law 98-21; and (2) payroll tax revenue forgone under the provisions of Public Laws 111-147, 111-312, 112-78, and 112-96.
    ${ }^{\mathrm{f}}$ Revenue from taxation of benefits is the amount that would be assessed on benefit amounts scheduled in the law.
    g Between - $\$ 50$ million and $\$ 50$ million.
    Note: Components may not sum to totals because of rounding.

[^11]:    ${ }^{1}$ See appendix F.

[^12]:    ${ }^{1}$ Adjustments include adding deemed wage credits based on military service for 1983-2001 and reflecting the lower effective tax rates (as compared to the combined employee-employer rate) that apply to multipleemployer "excess wages." Lower rates also applied to net earnings from self-employment before 1984 and to income from tips before 1988.

[^13]:    ${ }^{1}$ A program is solvent over any period for which the trust fund maintains a positive level of asset reserves. In contrast, the actuarial balance for a period includes the cost of having a target fund equal to 100 percent of the following year's cost at the end of the period. Therefore, if a program ends the period with reserves that are positive but not sufficient to cover the following year's costs, it will be solvent at the end of the period and yet still have a small negative actuarial balance for that period.
    ${ }^{2}$ The 3.33 percentage point increase in the payroll tax rate required to achieve 75 -year solvency differs somewhat from the 3.50 percent actuarial deficit. This is primarily because the rate increase required to achieve 75 -year solvency reflects a zero trust fund reserve at the end of the period, whereas the 3.50 percent actuarial deficit incorporates an ending trust fund reserve equal to one year's cost. While such an increase in the payroll tax rate would cause some behavioral changes in earnings and ensuing changes in benefit levels, such changes are not included in these calculations because they are assumed to have roughly offsetting effects on OASDI actuarial status over the 75-year long-range period as a whole.

[^14]:    ${ }^{1}$ The calculation of the payroll tax rate increase required to eliminate the actuarial deficit also does not include the effects of behavioral changes, because they are assumed to have roughly offsetting effects.

[^15]:    ${ }^{1}$ The present value of taxable payroll for 2024-98 is $\$ 681.8$ trillion. The present value of GDP for 2024-98 is $\$ 1,944.1$ trillion. In last year's report, the present value of taxable payroll for 2023-97 was $\$ 655.0$ trillion and the present value of GDP was $\$ 1,865.3$ trillion.

[^16]:    ${ }^{1}$ Actuarial Studies published by the Office of the Chief Actuary, Social Security Administration, contain further details about the assumptions, methods, and actuarial estimates. A complete list of available studies may be found at www.ssa.gov/OACT/NOTES/actstud.html. This entire report, along with supplemental year-by-year tables and additional documentation on assumptions and methods, may be found at www.ssa.gov/OACT/TR/2024/.
    ${ }^{2}$ Birth rates at age 14 include births to girls aged 14 and under, and birth rates at age 49 include births to women aged 49 and over.
    ${ }^{3}$ The total fertility rate may be interpreted as the average number of children that would be born to a woman if she were to experience, at each age of her life, the birth rate observed in, or assumed for, a specified year, and if she were to survive the entire childbearing period. A rate of about 2.1 would ultimately result in a nearly constant population if immigration and emigration were both zero, and if death rates were to remain at current levels.
    84

[^17]:    ${ }^{1}$ These rates reflect NCHS data on deaths and Census estimates of population. NCHS death data for 2022 are provisional.
    ${ }^{2}$ These rates reflect Medicare data on deaths and enrollments.

[^18]:    ${ }^{1}$ Based on the enumerated total population as of April 1, 2010, if that population were to experience the death rates by age and sex for the selected year.
    ${ }^{2}$ Cause of death is only available for the NCHS data

[^19]:    ${ }^{1}$ These average annual rates of decline between 2023 and 2098 are not directly comparable with the 75 -year average annual rates of decline shown in recent reports. This is because the death rates for the first year in each report's valuation period, which are used as the starting points for the 75 -year geometric averages, have varied significantly due to the effects of the pandemic.

[^20]:    ${ }^{1}$ Persons who enter the country with legal visas but without LPR status, such as temporary foreign workers and students, are not included in the "LPR immigration" category.

[^21]:    ${ }^{1}$ On a monthly basis, economic activity peaked in February 2020, but the decline in March was sharp enough that the output in the first quarter of 2020 was substantially below the output in the fourth quarter of 2019. See www.nber.org/news/business-cycle-dating-committee-announcement-june-8-2020.

[^22]:    ${ }^{1}$ Historical levels of real GDP are from the National Income and Product Accounts (NIPA) produced by the Bureau of Economic Analysis (BEA). Historical total hours worked are provided by the Bureau of Labor Statistics (BLS) and cover all U.S. Armed Forces and civilian employment.
    ${ }^{2}$ These assumptions for total-economy productivity are consistent with ultimate annual increases in private nonfarm business productivity of $2.36,2.00$, and 1.63 percent. Private nonfarm business productivity excludes the farm, government, nonprofit institution, and private household sectors.

[^23]:    ${ }^{1}$ BLS produces a series called the Consumer Price Index Research Series Using Current Methods (CPI-U-RS) that approximates the measured rate of inflation since 1978 had the method currently used been in effect since then. BLS does not revise the CPI values published in earlier years, for which different methods were used. These CPI published values are shown in table V.B1. The Trustees use an adjusted CPI series based on the CPI-U-RS when setting the ultimate price inflation assumption because it provides a time series that is consistent with the current method for computing the CPI.

[^24]:    ${ }^{1}$ Covered employment for a year is defined as the total number of persons who have any OASDI covered earnings (that is, earnings subject to the OASDI payroll tax) at any time during that year. See section V.C. 2 for a more detailed discussion of covered employment.
    ${ }^{2}$ See section V.C. 1 for a discussion of the AWI and the parameters indexed to it.

[^25]:    ${ }^{1}$ The sole exception is employment in the U.S. Armed Forces, which has declined in size over the last 40 years and is assumed to remain at its 2023 level throughout the 75 -year projection period.

[^26]:    ${ }^{1}$ The Office of the Chief Actuary adjusts the labor force participation rates to the 2020 age distribution of the civilian noninstitutional U.S. population. In the 2023 report, the labor force participation rates were adjusted to the 2011 age distribution of the civilian noninstitutional U.S. population.
    ${ }^{2}$ In the 2023 report, the assumed ultimate unemployment rates were adjusted using the age-sex distribution of the 2011 civilian labor force. Retaining the same aggregate ultimate unemployment rates requires slightly higher underlying age-sex-specific unemployment rates in this report than in the 2023 report.

[^27]:    ${ }^{1}$ The assumed ultimate unemployment rates are age-sex-adjusted rates. For the high-cost assumptions, the age-sex-adjusted unemployment rates for 2027 through 2033 are approximately 0.1 percentage point higher than the rates without adjustment for the changing age-sex distribution, which are shown in table V.B2.
    ${ }^{2}$ Average weekly total employment is the sum of average weekly U.S. civilian employment, which can be expressed as a product of the total civilian labor force and the complement of the unemployment rate, and U.S. Armed Forces.

[^28]:    1 The Federal Register publishes details of these indexation procedures annually. Also see www.ssa.gov/OACT/COLA/.

[^29]:    ${ }^{1}$ For those under age 16, projected covered employment is the sum of age-sex components, each of which is projected as a ratio to the Social Security area population.

[^30]:    ${ }^{1}$ Age-adjusted covered-worker rates are adjusted to the 2020 age distribution of the Social Security area population.

[^31]:    ${ }^{1}$ Those granted legal work authorization through the 2012 Deferred Action for Childhood Arrivals program are included in the simulations.

[^32]:    ${ }^{1}$ The exposed population is the fully insured population age 62 and over, excluding persons entitled to or converted from disabled-worker benefits and fully insured persons entitled only to widow(er) benefits.
    ${ }^{2}$ The employment rate is the ratio of U.S. civilian employment to the civilian noninstitutional population.

[^33]:    ${ }^{1}$ Deemed filing does not apply if the spouse is caring for an entitled child or is receiving a disabled-worker benefit.

[^34]:    ${ }^{1}$ The disability-exposed population excludes those receiving benefits, while the disability insured population includes them. Section V.C. 3 of this report describes the projection of the disability insured population.

[^35]:    ${ }^{1}$ Projected incidence rates are adjusted upward to account for additional workers who are expected to file for disability benefits (rather than retirement benefits) in response to reductions in retirement benefits as the normal retirement age rises.

[^36]:    ${ }^{1}$ The taxable ratio drifts down slightly after 2033, to $84.0,82.3$, and 80.7 percent for 2098 for the low-cost, intermediate, and high-cost assumptions, respectively, as self-employment income (which has a lower percent taxable than wages) becomes an increasing share of total earnings.

[^37]:    ${ }^{1}$ Generally, the higher the amount of liability, the sooner the taxes must be paid. For smaller employers, payment is due by the middle of the month following when the liability was incurred. Medium-size employers have three banking days in which to make their deposits. Larger employers must make payment on the next business day after paying their employees.
    2 Table VI.G1 shows the payroll tax contribution rates for the Hospital Insurance (HI) program.

[^38]:    ${ }^{1}$ Actuarial Note 2024.9 has additional detail on illustrative benefits for hypothetical workers. See www.ssa.gov/OACT/NOTES/ran9/.

[^39]:    ${ }^{1}$ Actuarial Note 2024.3 has more details on scaled-earnings patterns. See www.ssa.gov/OACT/NOTES/ran3/.

[^40]:    ${ }^{\text {a }}$ Annual amounts are the total for the 12 -month period starting with the month of retirement.
    ${ }^{\text {b }}$ Attains age 65 on January 1 of the year.
    ${ }^{\text {c }}$ CPI-indexed dollar adjustment uses the adjusted CPI indexing series shown in table VI.G6.
    ${ }^{\mathrm{d}}$ Career average earnings at about 25 percent of the national Average Wage Index (AWI).
    ${ }^{e}$ Career average earnings at about 45 percent of the AWI.
    ${ }^{\mathrm{f}}$ Career average earnings at about 100 percent of the AWI.
    ${ }^{\mathrm{g}}$ Career average earnings at about 160 percent of the AWI.
    ${ }^{\mathrm{h}}$ Earnings for each year at or above the contribution and benefit base.

[^41]:    ${ }^{1}$ The OASI and DI Trust Funds are distinct legal entities which operate independently. To illustrate the actuarial status of the program as a whole, the fund operations are often combined on a hypothetical basis.

[^42]:    ${ }^{1}$ The HI Trust Fund receives the additional tax revenue resulting from the increase to 85 percent.
    ${ }^{2}$ A special provision applies to benefits paid to nonresident aliens. Effective for taxable years beginning after 1994, Public Law 103-465 subjects benefits to a flat-rate tax, usually 25.5 percent, before they are paid. Therefore, this tax remains in the trust funds. From 1984 to 1994, the flat-rate tax was usually 15 percent.
    ${ }^{3}$ The Social Security Act requires the trust funds to acquire special-issue obligations unless the Managing Trustee determines that the purchase of marketable obligations is in the public interest. The purchase of marketable obligations has been quite limited and has not occurred since 1980.

[^43]:    ${ }^{1}$ Periodically, benefit payments which were scheduled to be paid on January 3 were actually paid on December 31 of the preceding year as required by the statutory provision included in the 1977 Social Security Amendments for early delivery of benefit payments when the normal payment delivery date is a Saturday, Sunday, or legal public holiday. Such advance payments have occurred about every 7 years, first for benefits scheduled for January 3, 1982. The most recent such accelerated payment affected benefits scheduled to be paid on January 3, 2021. For comparability with the values for historical years and the projections in this report, all trust fund operations and asset reserves reflect the 12 months of benefits scheduled for payment each year without regard to the accelerated payments described above.

[^44]:    ${ }^{1}$ Based on the enumerated total population as of April 1, 2010, if that population were to experience the death rates by age and sex for the selected year.

[^45]:    ${ }^{1}$ Age-sex-adjusted to the disability-exposed population as of the year 2000.

[^46]:    ${ }^{1}$ Age-sex-adjusted to the disabled-worker population as of the year 2000.

[^47]:    ${ }^{1}$ Age-sex-adjusted to the disabled-worker population as of the year 2000.

[^48]:    ${ }^{1}$ More detail on this model is available at www.ssa.gov/OACT/NOTES/pdf studies/study128.pdf.

[^49]:    ${ }^{1}$ While an increase in the payroll tax rate would cause some behavioral changes in earnings and ensuing changes in benefit levels, such changes are not included in the calculations because they are assumed to have roughly offsetting effects on OASDI actuarial status over the infinite horizon.

[^50]:    ${ }^{1}$ OASDI benefits paid for entitlement for a particular month are generally paid in the succeeding month. There are two primary exceptions to this general rule. First, payments can occur with a greater delay when a benefit award is made after the month of initial benefit entitlement. At the time of benefit award, benefits owed for months of prior entitlement are then also paid to the beneficiary. For the projections in this report, such retroactive payments are included in the period where they are paid (at time of award). Second, when benefit payments scheduled for January 3 are paid on the prior December 31, because January 3 falls on a Sunday, such payments are shown in this report for the period they were scheduled to be paid.

[^51]:    ${ }^{1}$ OASDI benefits paid for entitlement for a particular month are generally paid in the succeeding month There are two primary exceptions to this general rule. First, payments can occur with a greater delay when a benefit award is made after the month of initial benefit entitlement. At the time of benefit award, benefits owed for months of prior entitlement are then also paid to the beneficiary.
